Basic concepts and terminology in biostatistics

Objectives:

1. Definition of statistics and biostatistics and its application.
2. To understand different levels of measurements.
3. To understand different types of data.
4. To use these concepts appropriately.

Statistics

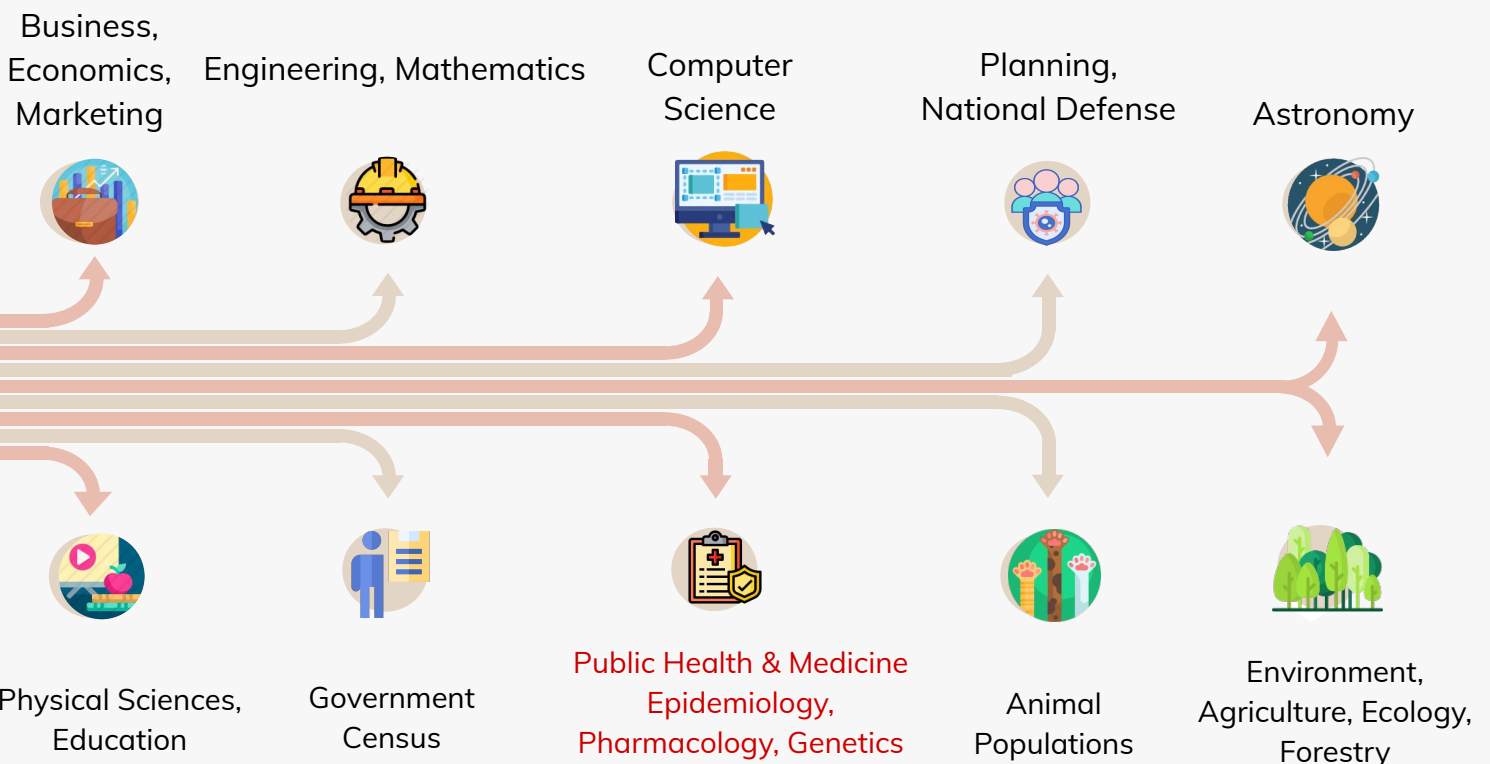

Statistics is the science of conducting studies to collect, organize, summarize, analyze, present, interpret and draw conclusions from data.

Data: Any values (observations or measurements) that have been collected.
Singular: datum

What is statistics?

Areas where statistics are used

Biostatistics

Biostatistics

is the science that **helps** in managing medical **uncertainties** and **variability** of data

Biostatistics

- Statistics arising out of biological sciences, particularly from the fields of medicine and public health.
- The methods used in dealing with statistics in the fields of medicine, biology and public health for planning, conducting and analyzing data which arise in investigations of these branches.

Biostatistics

Medical Statistics aka: clinical statistics -same as biostatistics-

Deals with application of statistical methods to the study of diseases (risk factors, prognostic factors, etc..), efficacy of new treatments or vaccine, etc..

Health Statistics - methodology is the same as medical statistics

Deals with application of statistical methods to varied information of public health importance.

Vital Statistics

Is the ongoing collection of government agencies of data relating to vital event such as **births and deaths** which are deemed reportables by local health authorities.

Basic Concepts

Data : Set of values of one or more variables recorded on one or more observational units (singular: Datum).

Sources of data

- Routinely kept records
- Surveys (census) population based
- Experiments
- External source

Categories of data

Primary data:

What principle investigator collect (new data) observation, questionnaire, record form, interviews, survey

Secondary data:

Collected from other source which data already is collected census, medical record, registry

Variables

Datasets and Data Tables

Dataset	Data Table
Data for a set of variables collection in group of persons.	A dataset organized into a table, with one column for each variable and one row for each person.

OBS	AGE	BMI	FFNUM	TEMP (oF)	GENDER	EXERCISE LEVEL	QUESTION
1	26	23.2	0	61.0	0	1	1
2	30	30.2	9	65.5	1	3	2
3	32	28.9	17	59.6	1	3	4
4	37	22.4	1	68.4	1	2	3
5	33	25.5	7	64.5	0	3	5
6	29	22.3	1	70.2	0	2	2
7	32	23.0	0	67.3	0	1	1
8	33	26.3	1	72.8	0	3	1
9	32	22.2	3	71.5	0	1	4
10	33	29.1	5	63.2	1	1	4
11	26	20.8	2	69.1	0	1	3
12	34	20.9	4	73.6	0	2	3
13	31	36.3	1	66.3	0	2	5
14	31	36.4	0	66.9	1	1	5
15	27	28.6	2	70.2	1	2	2
16	36	27.5	2	68.5	1	3	3
17	35	25.6	143	67.8	1	3	4
18	31	21.2	11	70.7	1	1	2
19	36	22.7	8	69.8	0	2	1
20	33	28.1	3	67.8	0	2	1

Table 1: Typical data table.

Definitions for variables

Age

Age in years.

BMI

Body mass index, weight/height² in kg/m²

FFNUM

The average number of times eating "fast food" in a week.

Temp

High temperature for the day.

Gender

1- Female
0- Male

Exercise Level

1- Low
2- Medium
3- High

Question

What is your satisfaction rating for this biostatistics session?

1- Very Satisfied 2- Somewhat Satisfied 3- Neutral
4- Somewhat dissatisfied 5- Dissatisfied

Variables

Types of variables and data

- When collecting or gathering data we collect data from individuals cases on particular variables.
- A **variable** is a unit of data collection whose value can vary.
- Variables can be defined into types **according to the level of mathematical scaling** that can be carried out on the data.
- There are **four types** of data or levels of measurement:

1 Nominal scale variables

2 Ordinal scale variables

3 Interval scale variables

4 Ratio scale variables

Nominal scale variables

- A type of categorical data in which objects fall into **unordered** categories.
- Studies measuring nominal data must ensure that each category is **mutually exclusive** (no overlap like Male / Female) and the system of measurement needs to be exhaustive.
- Variables that have only two responses i.e. Yes or no, are known as **dichotomies**. (Binary) but also can have more than 2 options like (blood group, name of cities or name of cars...etc)

Ordinal scale variables

- Ordinal data is data that comprises of categories that **can be rank ordered**.
- Similarly with nominal data the distance between each category **cannot be calculated** but the categories **can be ranked** above or below each other. (Low stress - Moderate stress - Severe Stress)

Interval scale variables

- **Fahrenheit temperature scale:** (zero is arbitrary) -40 degrees is not twice as hot as 20 degrees. You can't compare since no zero reference (there is negative).
- **IQ tests:** No such thing as zero IQ. 120 IQ not twice as intelligent as 60.
- Question- Can we assume that attitudinal data represents real, quantifiable measured categories? (i.e.. That 'very happy' is twice as happy as plain 'happy' or that 'very unhappy' means no happiness at all). "Statisticians not in agreement on this". **NO!. You can't quantify it, negative values are included.**

Ratio scale variables

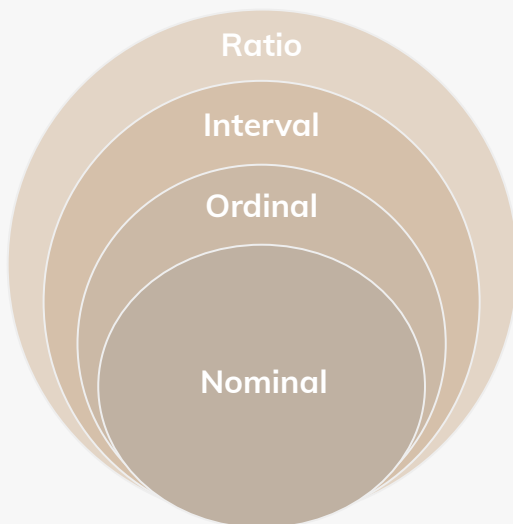

- The distance between any two adjacent units of measurement (intervals) is the same and there is **a meaningful zero point**.
- Income: someone earning SAR20,000 earns twice as much as someone who earns SAR10,000.
- Height
- Weight
- Age
- **Negative values are not included**
- **It can be compared (best scale for comparison)**

Variables

Scales of Measurement

Hierarchical data order

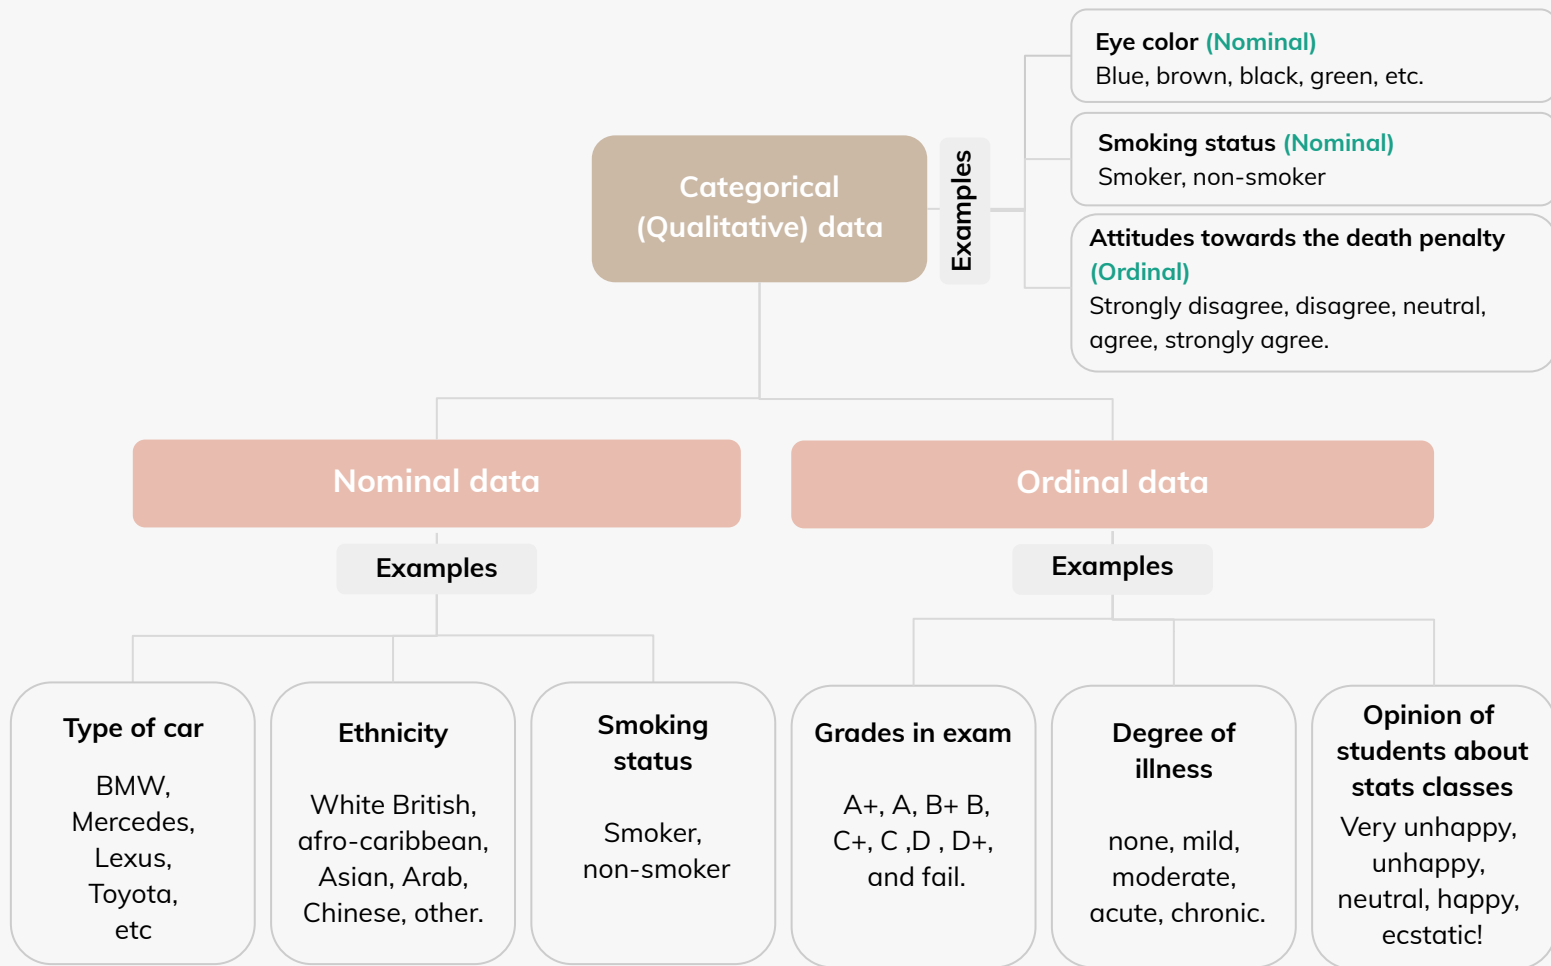

These levels of measurement can be placed in hierarchical order.

- Nominal data is the least complex and give a simple measure of whether objects are the same or different.
- Ordinal data maintains the principles of nominal data but adds a measure of order to what is being observed.
- Interval data builds on ordinal by adding more information on the range between each observation by allowing us to measure the distance between objects. **No absolute zero value.**
- Ratio data adds to interval with including an **absolute zero.**

Categorical Data

Categorical Data (Qualitative data)

- The objects being studied are grouped into categories based on some **qualitative** trait.
- The resulting data are merely labels or categories.
- **Nominal** and **Ordinal** scales will be used for categorical data or qualitative data.

Binary Data (dichotomies)

A type of categorical data in which there are only **two categories**.

Examples:

- Smoking status- smoker, non-smoker, **past smoker**
- Attendance: present, absent
- Result of a exam: pass, fail
- Status of student: undergraduate, postgraduate

Dr: it's important in the exam to know that it can be more than two categories
"blood groups as example"

Quantitative Data

Nominal data (Binary) & Ordinal data (Examples)

What is your Gender?

(please tick)

- Male
- Female

Did you enjoy the session?

(please tick)

- Yes
- No

What is the level of satisfaction with the new curriculum at a medical school received? (please tick)

- Very satisfied
- Somewhat satisfied
- Neutral
- Somewhat dissatisfied
- Very dissatisfied

Quantitative Data

- The objects being studied are '**measured**' based on some **quantitative** trait.
- The resulting data are set of numbers.
- **Interval and Ratio** scales will be used to measure quantitative data.

Quantitative data

Discrete

Only certain values are possible (there are **gaps** between the possible values).

Implies counting.

A whole number.

For example:

- Number of family members,
- Number of smoked cigarette

Gaps between possible values

Number of Children

Continuous

Theoretically, with a fine enough measuring device.

Implies measuring.

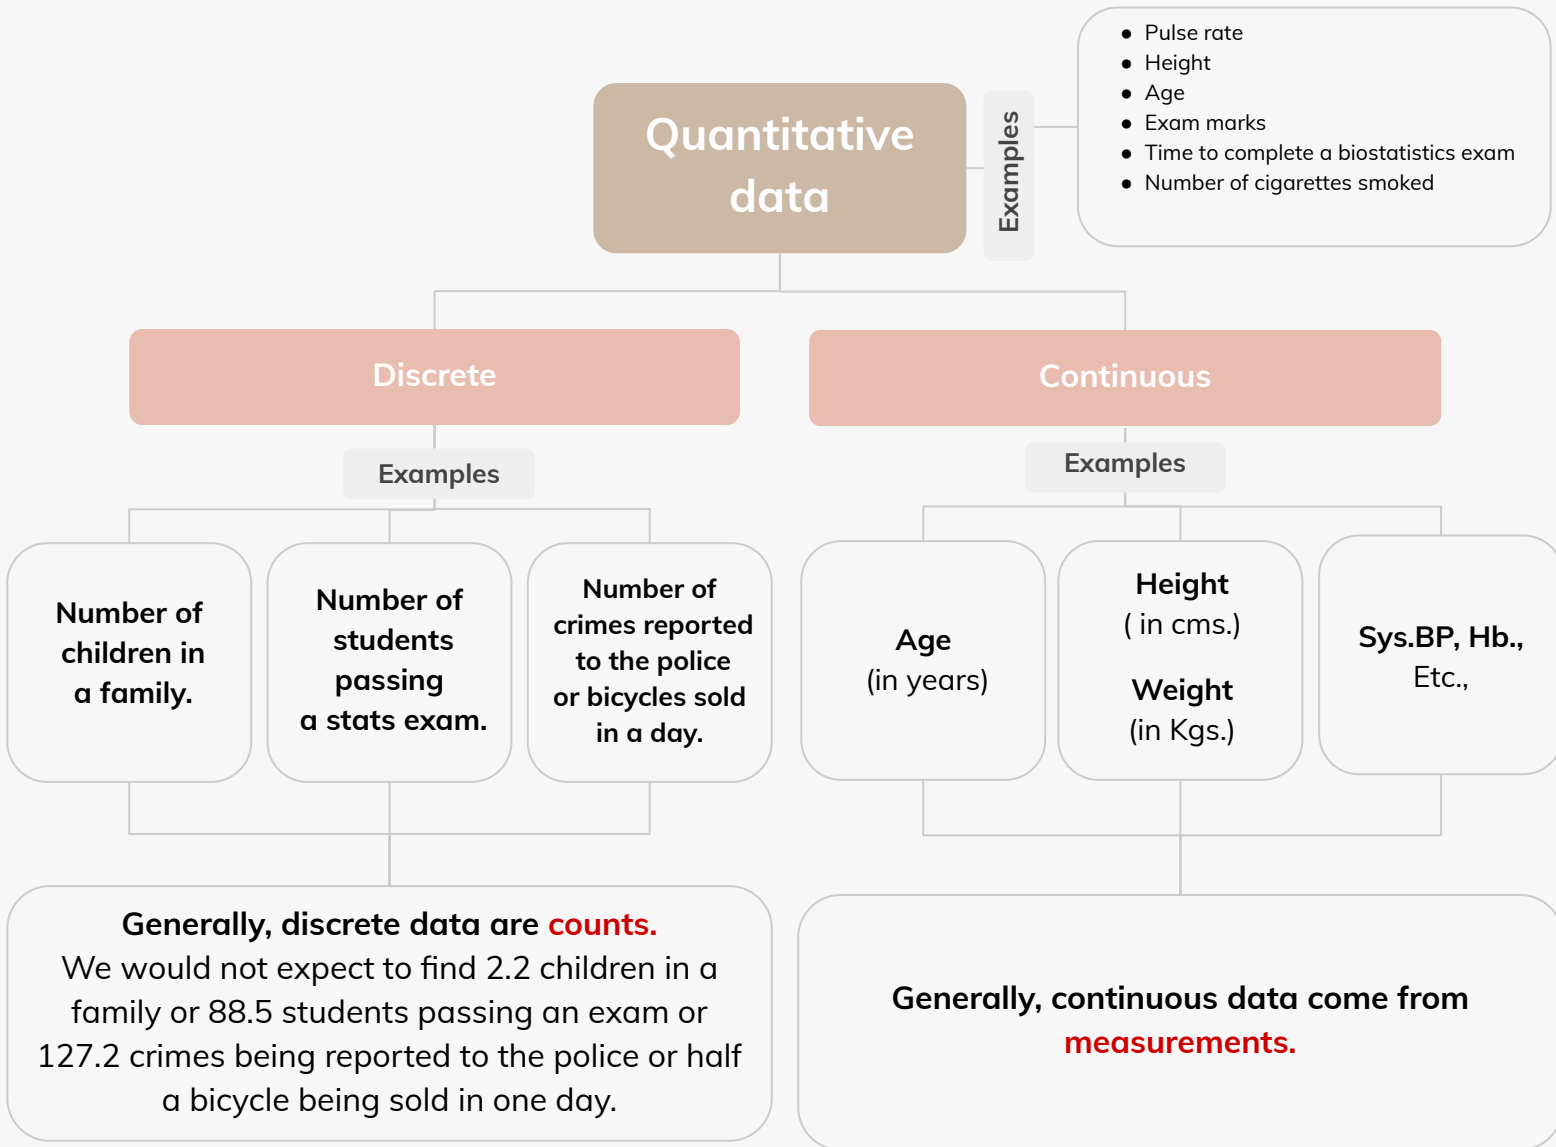

There is a decimale.

Theoretically, no gaps between possible values

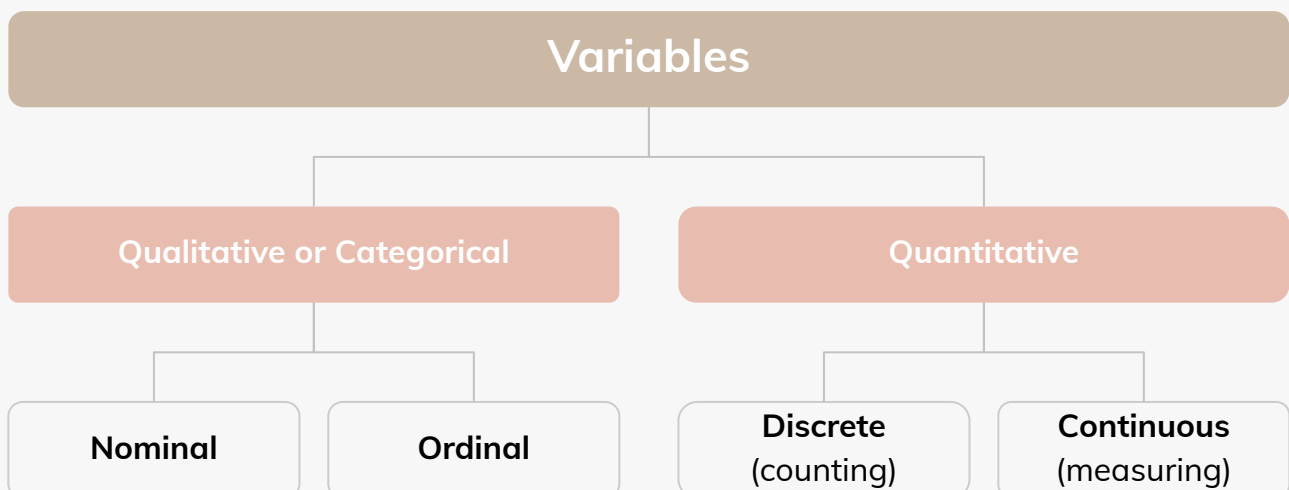

Hb

Quantitative data

Relationships between variables

Relationships between variables

Quantitative Variables	Qualitative variables
Height (cm / feet) (Continuous)	Short / Medium / Tall (ordinal)
Weight (kg / pound) (Continuous)	Underweight / Normal weight / Overweight (ordinal)
Blood sugar (mg %) (Continuous)	Diabetic / Non-Diabetic (nominal)
Blood pressure (mm) (Continuous)	Normal blood pressure / Hypertension (nominal, if more options then it will become ordinal)
Hemoglobin (mg %) (Continuous)	Anaemic / Non-Anaemic (nominal)

CONTINUOUS DATA → QUALITATIVE DATA

Wt. (In kg.) → Under wt, normal & over wt. (ordinal)
 Ht. (In cm.) → Short, medium & tall. (ordinal)

hospital length of stay	Number	Percent
1 – 3 days	5891	43.3
4 – 7 days	3489	25.6
2 weeks	2449	18.0
3 weeks	813	6.0
1 month	417	3.1
More than 1 month	545	4.0
Total	14604	100.0
Mean = 7.85 SE = 0.10		

Table 2: Distribution of blunt injured patients according to hospital length of stay.

Sometimes continues data can be converted into qualitative data.
 for example: Stress score into (Low stress - Moderate stress - Severe stress)

Clinimetrics and Data types

Clinimetrics

A science called clinimetrics in which qualities are converted to meaningful quantities by using the scoring system. (Categorical data converted into quantitative data)

Examples:

1. **Apgar score** based on **appearance, pulse, grimace, activity** and **respiration** is used for neonatal prognosis. Appearance: Skin color (categorical) into the score .
2. **Smoking index**: no. of cigarettes, duration, filter or not, whether pipe, cigar etc.
3. **APACHE (Acute Physiology and Chronic Health Evaluation)** score: to quantify the severity of condition of a patient.

Data types – important?

- Why do we need to know what type of data we are dealing with?
The data type or level of measurement **influences the type of statistical analysis techniques** that can be used when analysing data.

To conclude

Type of variables in any data set are:	The scales to measure these two variables are:
Categorical (Qualitative) & Quantitative	Nominal, Ordinal, Interval and Ratio scales

Summary

Variables			
Nominal	Ordinal	Interval	Ratio
<ul style="list-style-type: none"> Unordered (not ranked) Mutually exclusive: ex: female / male Exhaustive system of measurement. Two responses variables: ex: Yes/ no 	<ul style="list-style-type: none"> Can be ranked ordered Distance between each category cannot be calculated 	<ul style="list-style-type: none"> Zero is arbitrary Fahrenheit temp IQ test 	<p>Has a meaningful zero point</p> <p>ex: Height Weight Age</p>
Categorical (Qualitative)		Quantitative	
<p>The objects being studied are grouped into categories based on some qualitative trait.</p> <p>Nominal & Ordinal</p>		<p>The objects being studied are 'measured' based on some quantitative trait.</p> <p>Discrete & Continuous</p>	
Nominal	Ordinal	Discrete	Continuous
<ul style="list-style-type: none"> Type of car Ethnicity Smoking status 	<ul style="list-style-type: none"> Grades in exam Degree of illness 	<p>There are gaps between the possible values.</p> <p>Implies counting</p>	<p>No gaps between possible values</p> <p>Implies measuring</p>
Binary Data		<p>Example:</p> <ul style="list-style-type: none"> Number of children in the family number of students passing a test Number of crimes reported 	<p>Example:</p> <ul style="list-style-type: none"> Age Height Weight
<p>A type of categorical data in which there are only two categories.</p>			
<ul style="list-style-type: none"> Smoking status Attendance Result of exam Status of student 			

Questions

(1) Which one of the following types of variables include absolute zero?

- A) Nominal data
- B) Ordinal data
- C) Interval data
- D) Ratio data

(2) Out of those variables, which can be considered as categorical ordinal data?

- A) Smoking status
- B) Grades in exam
- C) Types of car
- D) Height

(3) Which one of these values can be considered as discrete value?

- A) 2.2 children in the family
- B) 88 cm height
- C) 14 students passed
- D) 12.7 crimes reported

(4) Which one of the following types of variables has mutually exclusive values?

- A) Nominal data
- B) Ordinal data
- C) Interval data
- D) Ratio data

(5) The levels of measurement can be placed in hierarchical order which is?

- A) Ratio > ordinal > interval > nominal
- B) Ratio > interval > ordinal > nominal
- C) Interval > ordinal > nominal > ratio
- D) Ordinal > interval > nominal > ratio

(6) Out of those variables, which can be considered as categorical nominal data?

- A) Sex
- B) Rate of satisfaction
- C) Number of children in the family
- D) Height in cm

Answers:

1: D | 2: B | 3: C | 4: A | 5: B | 6: A

Questions

(7) What is the type of scale measurement for a variable “serum creatinine (mg/dl)?

- A) Ratio scale
- B) Interval scale
- C) Nominal scale
- D) Ordinal scale

(8) What is the type of variable measurement scale for cancer stages (I, II, III< IV)?

- A) Qualitative variable, nominal scale
- B) Qualitative variable, ordinal scale
- C) Quantitative variable, interval scale
- D) Quantitative variable, ratio scale

(9) The grades of geometry test were classified as A+, A, B+, B, C+, C, D+, D, F. What is the best scale to measure this type of data?

- A) Interval
- B) Numerical
- C) Ordinal
- D) Nominal

(10) Which is the type of scale measurement for systolic blood pressure?

- A) Ordinal
- B) Nominal
- C) Ratio
- D) Interval

(11) Which of the following deals with application of statistical methods to varied information of public health importance?

- A) Medical statistics
- B) Health statistics
- C) Vital statistics
- D) Safety statistics

(12) What is the type of variable and measurement scale for serum cholesterol?

- A) Qualitative variable, nominal scale
- B) Qualitative variable, ordinal scale
- C) Quantitative variable, interval scale
- D) Quantitative variable, ratio scale

Answers:

7: A | 8: B | 9: C | 10: C | 11: B | 12: D

Thank you for checking our work!
