COMMON ADULT'S FRACTURES Dr. Sultan Aldosari, MBBS, FRCSC.

OBJECTIVES

- CLAVICAL FRACTURE
- HUMERUS (PROXIMAL & SHAFT)
- BOTH BONE FOREARM FRACTURS
- DISTAL RADIUS FRACTURE
- HIP FRACTURE
- FEMUR SHAFT FRACTURE
- TIBIAL SHAFT FRACTURE
- ANKLE FRACTURE

CLAVICLE FRACTURE Clavicle is S shape bone It is anchored to scapula via ACJ. It is anchored to trunk via SCJ Most of fracture occurs as result from fall onto shoulder.

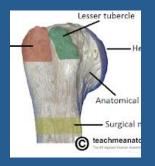

PROXIMAL HUMERUS ANATOMY

- Proximal humerus has four anatomic parts:
 - Head
 - Greater tubrosity
 - Lesser tubrosity
 - Shaft
- Anatomic neck v.s surgical neck.

PROXIMAL HUMERUS FRACTURE

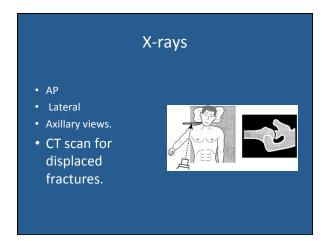

- In younger patients: violent trauma.
- In older patients: minor trauma.
- Most fractures are minimally displaced.

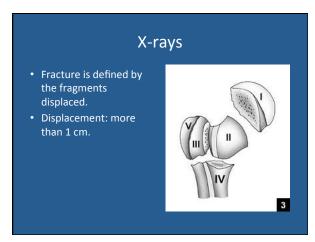

PHYSICAL EXAM

- Expose the shoulder very well.
- Look for fracture signs
- Check the skin.
- Peripheral N/V exam.
- Axillary nerve: lateral skin patch.
- Examine cervical spine.

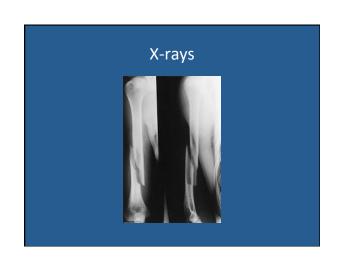

- If fracture is not displaced:
 - Treatment with sling and NWB of UE for 6-8 weeks.
 - Early ROM exercises after 2-4 weeks.
 - Normal function can be resumed after 3-4 months.

- If the fracture is displaced:
 - Surgery is indicated.
 - ORIF is indicated (plate and screws).
 - Shoulder hemiarthroplasty is indicated in some cases.

HUMERUS SHAFT FRACTURE

- It can be classified based on location of fracture. (proximal, middle and distal)
- Fracture symptoms.
- On exam:
 - Skin
 - -N/V
 - Compartment
- Watch for radial nerve palsy.

- Almost all humerus shaft fracture can be treated non-surgically.
 - Close reduction
 - Functional brace x 4-6 weeks + NWB
 - Early ROM of elbow and shoulder.

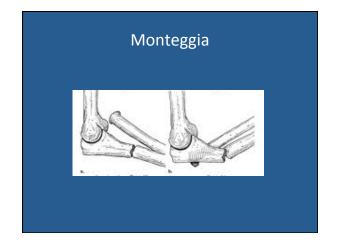

- Surgery is indicated for specific conditions like:
 - Segmental fracture
 - Open fracture
 - Obese patient
 - Bilateral fracture
 - Floating elbow (forearm and humerus)
- Surgery: ORIF with plate and screws.

BOTH BONES FOREARM FRACTURE

- Forearm is complex with two mobile parallel bones.
- Radius and ulna articulate proximally and distally.
- It very unlikely to fracture only one bone without disruption of their articulation:
 - <u>– Both bone fracture</u>
 - Monteggia fracture
 - Galeazzi fracture.

- Fractures are often from fall or direct blow.
- Both bones fracture:
 - Means radius and ulna are broken.
- Monteggia fracture:
 - Means proximal or middle third ulna shaft fracture with dislocation of radius proximally (at elbow)
- Galeazzi fracture:
 - Means distal third shaft radius fracture with disruption of DRUJ.

CLINICAL

- Symptoms and signs of fracture
- Check the skin
- Check the compartments of forearm
- Check Ulnar, median and radial nerve (PIN,AIN)
- Check vascularity: color, temperature, capillary refill and pulse.

Investigations

- 2 orthogonal views
- CT scan if fracture extends into joint.

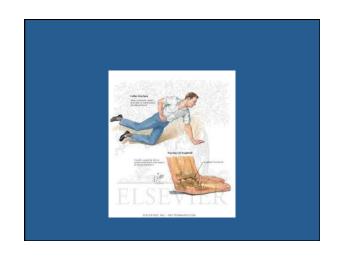

Treatment

- Both bone fracture:
 - Reduce and splint at ER/clinic (temporary)
 - Are treated almost always with ORIF: (plate and screws)
- Monteggia fracture:
 - ORIF ulna and close reduction of radial head
- Galeazzi fracture:
 - ORIF radius and close reduction of DRUJ.

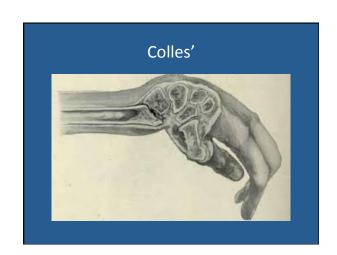

DISTAL RADIUS FRACTURE

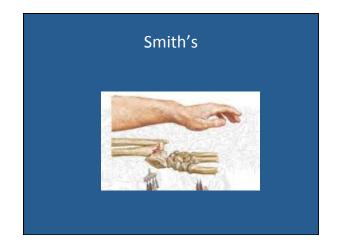

- Most common fracture of upper extremity.
- Most frequently are seen in older women.
- Young adults fractures are most commonly secondary to high energy trauma.

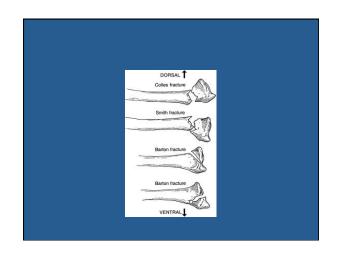

• Extra-articular:

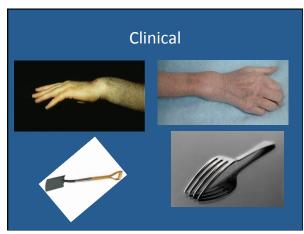

- Colles' Fracture: dorsal angulation, shortening and radial deviation
- Smith's fracture: shortening and volar angulation. (reverse Colles')
- Intra-articular:
 - Barton's fracture: volar or dorsal
 - others

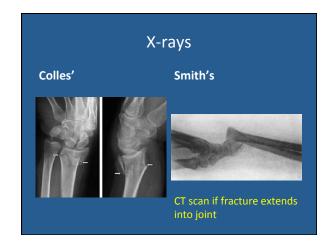

- Extra-articular fractures:
 - Close reduction and cast application.
 - Immobilization for 6-8 weeks.
 - ROM exercises after cast removal.
 - Surgery: if reduction is not accepted
- Intra-articular fracture:
 - a step more than 2 mm is an indication for surgery.
 - ORIF with plate and screws.

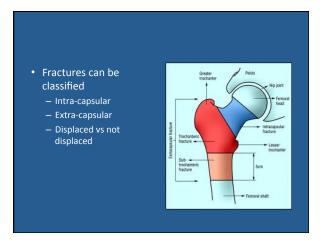

HIP FRACTURE

(Old Patients: > 60 yrs)

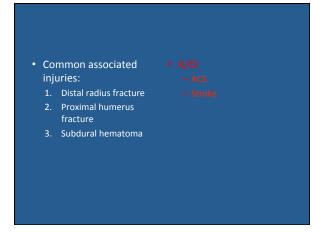

- It is the most common fracture of LL.
- It is associated with osteoporosis.
- Most common mechanism is a fall from standing height.
- Other causes of fall (stroke, MI) should be rolled out during clinical evaluation.
- It is a life changing event.

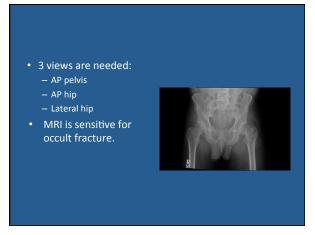

Intra-capsular: Subcapital Trans-cervical Extra-capsular: Basicervical Intertrochanteric AVN risk is higher with intra-capsular fracture. Intra-capsular fracture.

Clinical

- Full detailed history of mechanism of injury.
- R/O syncope, chest pain, weakness etc.
- A detailed systemic review.
- Deformity: Abduction, External rotation and shortening.
- Assess distal N/V status
- Avoid ROM if fracture is expected.

Treatment

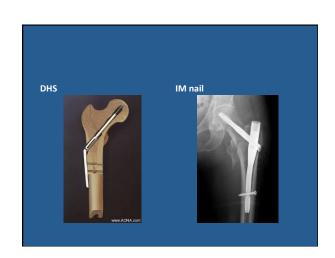

- No close reduction is needed.
- No traction is needed.
- Patient needs surgery ideally within 48 hrs.
- The goal is to ambulate patient as soon as possible.
- Be sure that DVT prophylaxis is started.
- Be sure that patient will be evaluated for osteoporosis after discharge.

Treatment

- If fracture is intracapsular:
 - Displaced:
 - hemiarthroplasty
 - Not displaced:
 percutaneous in situ
 Screws fixation.

- If fracture is Extracapsular:
 - Stable: Close reduction and DHS
 - Unstable: Intramedullary devise
- Fracture instabilities signs:
 - 1. Large LT fragment
 - Extension to
 subtrochantric region
 - 3. 4 parts fracture.

Complications

- Nonunion
 - 2% (IT fractures
 - 5% (non displaced neck fracture)
 - 30% (displaced neck fracture)
- AVN (femoral neck fracture):
 - 10% (non displaced)
 - 30% (displaced)
- Death: early 4 %. At 1 year: 20-40 %
- VTE

Femoral Neck FRACTURE (Young Patients)

- It is a completely different entity from similar fractures in elders (>60 years).
- · High energy mechanism.
- ATLS protocol.
- 2.5%: associated femoral shaft fracture. (long femur X-ray)
- Patient should be taken to operative room for ORIE within 6 hours
- Nonunion: 30% (most common complication)
- AVN: 25-30%

Femur Shaft Fracture

- Most common:
 - high energy mechanisms
 - Young patients (male, < 30 years).
 - ATLS protocol.
- Less common:
 - low energy mechanism (torsional forces)
 - Old patients.
 - Spiral type fracture.
- R/O pathological fracture in Young + low energy mechanisms.

- Associated musculoskeletal injuries:
 - ➤ Ipsilateral femoral neck fracture (10%. Missed in 30-50%)
 - >Knee ligaments injuries: 50%
 - ➤ Meniscal tear 30%
 - ➤ Floating knee injury: less common
 - ➤ Vascular/nerve injuries: rare
 - Contralateral femur shaft fracture (worse prognosis among above)

- Associated non-MS injuries:
 - ≻Fat embolism
 - **≻**ARDS
 - ➤ Head injuries.
 - ➤ Abdominal injuries

Clinical

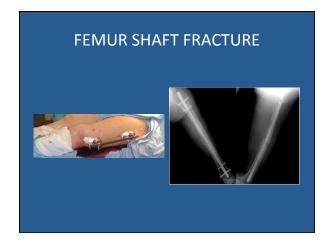

- ATLS
- Fracture symptoms and signs
- Skin integrity
- N/V exam.
- Compartment assessment
- Knee swelling or ecchymosis.

Investigations

- AP and lateral views femur
- 15° Internal rotation AP view ipsilateral hip.
- Lateral view ipsilateral view
- If femoral neck fracture is suspected: CT scan hip.
- Knee AP and lateral views

Management

- ATLS: ABC resuscitation.
- Skeletal traction (proximal tibial pin)
- Early surgical fixation:
 - > Proven to reduce Pulmonary complications.
 - ➤ Must be within 24 hrs (ideally < 6 hrs)
 - ➤If patient is unstable: External fixation.
 - ➤If Patient is stable IM nailing

Complications

- Malunion:
 - ≻most common.
 - ➤ More common with proximal fracture (subtrochantric fracture)
 - ► Rotational, angulation and shortening
- Nonunion: rare
- Infection.
- VTE.

TIBIA SHAFT FRACTURE

- It is a subcutaneous bone (high suspicion for skin injury.
- Most common large long bone fracture.
- It can be secondary to low or high energy mechanism.
- It carries the highest risk of compartment syndrome.
- 20 % of tibial fracture can be associated with ankle intra-articular fracture.

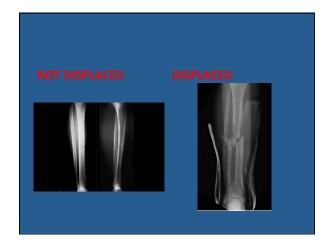

- It can be classified based on location and morphology:
 - Proximal third
 - Middle third
 - Distal third
- Displaced vs. Non-displaced:

• Clinical:

- Skin integrity.
- Assess compartments of leg: needs serial exam.
- Serial N/V exam.

INVESTIGATIONS

- X-rays:
 - AP and lateral tib/fib .
 - AP/lateral knee
 - AP/ Lateral ankle
- CT SCAN IF FRACTURE EXTENDS INTO JOINTS ABOVE OR BELOW.

MANAGEMENT

- Indications for non-surgical treatment:
 - NO displacement : < 10° angulation on AP/lateral x rays.
 - < 1 cm shortening.</p>
 - Not comminuted.
- C/I:
 - Displacement.
 - Open fracture.
 - Compartment syndrome.
 - Floating knee.

MANAGEMENT

- Close reduction and cast immobilization:
 - Above knee back slab and U slab if surgical treatment is chosen.
 - Above knee full cast if non-surgical treatment is chosen: it must be bivalved to minimized compartment syndrome.
 - Always provide patient with Compartment Syndrome checklist if patient is discharged home with cast.
 - NWB for 8 weeks with cast immobilization.

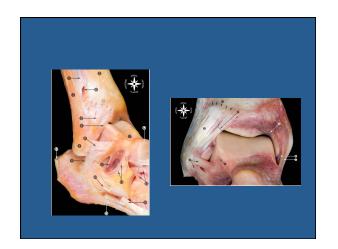

COMPLICATIONS

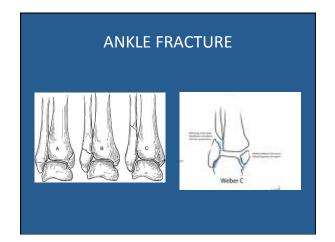

- Non-union: most common complication.
- Delayed union
- Infection: open fracture
- DVT/PE

ANKLE FRACTURE

- Ankle anatomy:
 - Medial and lateral malleoli, distal tibia and talus.
 - Highly congruent joint
 - Fibula is held to distal tibia by syndosmotic ligament.
 - Medial malleolus is held to talus by deltoid ligament.
 - Lateral malleolus is held to talus by LCL.

- Low energy (torsional): malleoli fracture.
- Classification:
 - > Stable v.s Unstable fracture:
 - > lateral displacement of talus
 - ➤ Medial, lateral or bimalleolar fracture
 - ➤ Lateral malleolus: Weber A, B, C

CLINICAL

- Look for Fracture symptoms and signs.
- Assess medial joint ecchymosis or tenderness to assess medial malleolus and deltoid ligament integrity.
- Assess N/V status (before and after reduction).

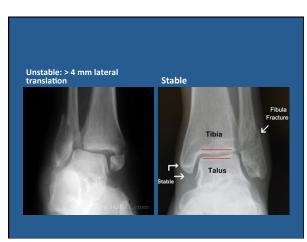

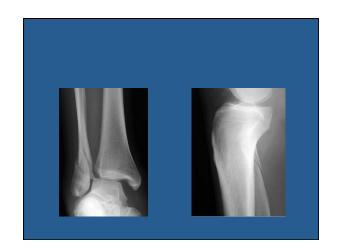

X-rays:

AP
Lateral
Mortise view
Long leg x-rays: if only medial malleolus is broken.

CT SCAN IF FRACTURE EXTENDS TO ARTICULAR DISTAL TIBIA SURFACE.

THANKS
