

[Color index: Important | Note: F1 &F2 | Extra] EDITING FILE

Notes:

- > Don't skip any picture it is very important for exam
- Yellow highlights are Exam Question.
- Doctor notes are very helpful for better understanding.
- ➤ In exam it is a MUST to have picture of:
 - o Glaucoma "cupping"
 - o Diabetic Retinopathy DR
 - Pallor of Disc

Done by: Afnan AlMalki.

Revised by: Rawan Aldhuwayhi

Resources: Slides + 435 team + Notes + ophthobook.

INTRODUCTION TO CHRONIC VISUAL LOSS

Definition: Slowly progressive painless visual loss.

Vision: So how can we assess the vision?

✓

o Quantity: VA (Visual acuity)

Quality: VF (Visual Field), clarity of vision, color vision

لما نتكلم عن البصر و الرؤية بشكل عام هو مو بس شيء نقيسه بالأرقام هذا مفهوم خاطئ فيه ناس نظرهم بالأرقام سليم كامل سته على سته لكن عندهم مشاكل في نوعية النظر مثلا اللي عندهم عمى الألوان أو الاشخاص اللي يشوفون الشكل ويقدرون يتعرفون عليه مثلا يعرفون ان هذا مربع بس عليه غباش او مثلا يقدرون يشوفون الصورة بالوسط بس حوافها مايشون زين فمهم جدا نقيس النظر من وجهين النوع والكم

Causes:

Always be systematic

- 1. **Refractive** the most common
- 2. Cornea
- 3. Lens
- 4. Vitreous
- 5. Retina
- 6. Optic Nerve
- 7. Neurologic

Now let's discuss each of them one by one

1.REFRACTIVE

Occurrence:

Mostly in <u>voung</u> patients

Causes:

- Myopia, hyperopia or astigmatism.
- o Amblyopia: کسل العین
 - → Patient who developed refractive error earlier in life and they don't treat it they might develop Amblyopia. Simply: brain tends to ignore the weak eye, brain will be confused, thus can't fuse images

Myopia: image will be anterior to Retina. So, why they are wearing negative glasses? it will bring the image to the Retina. What is the cause of myopia? check Refractive error lecture

Hyperopia: image will be posterior to Retina. Opposite to myopia Astigmatisms: اللابؤرية في هذه الحالة بدل أن يتجمع الضوء الداخل إلى العين في نقطة واحدة والمسبب الشويشًا غير منتظم للرؤية ، سبب واقعة على الشبكية فإنه يتشتت ويتجمع في عدة نقاط مسببا تشويشًا غير منتظم للرؤية ، سبب القرنية عدم تساوي تحدب القرنية

Signs:

- o Normal exam (however Sometimes patient with astigmatisms have **corneal scar** in examination)
- Refraction needed to show errors (everything will be normal except for visual acuity)

Treatment:

- o Glasses, Contact Lenses, Refractive surgery (lesser or PRK)
 - MB: lenticular causes needs cataract surgery.

2.CORNEA

"Cornea is Avascular tissue"

Cause:

- ► Scar: trauma, infection
 - o Hereditary: corneal <mark>dystrophies</mark>, keratoconus القرنية المخروطية

Why there is <u>scar</u> whenever you have trauma or infection? Because the collagen fibber intercalated with each other instead of being parallel it will cross each other causing scaring.

We suppress the scarring event by Steroid اغلب عمليات العيون يعطونهم ستيروبد بعد العملية لان الجراحة بحد ذاتها تعتبر تروماا=عشان كذا

Epithelium Bowman's layer Stroma Descemet's mentional mentions and the processing and t

Structure of the Cornea

Signs:

o corneal scar, bulging corneal, stromal opacities. Might have some conjunctival injection with chronicity

Treatment:

o Refraction, Contact lens (soft or hard), corneal cross linking, <u>keratoplasty</u> زراعة القرنية

You will treat the underlying conditions. If you have patient with corneal dystrophy or significant corneal scar→ simply replaces the scars corneal tissue with another tissue = keratoplasty "multiple options"

• Penetrating keratoplasty: ناخذ القرنية كاملة ونزرعها

Keratoconus

- What is the sign? Munson's sign is a V-shaped indentation observed in the lower eyelid when the patient's gaze is directed downwards بس خلي يطالع تحت Develop In advance keratoconus
- Can patient with keratoconus develop scar? Yes, the cornea is coning anteriorly so once its cones anteriorly you know that you are having a layer within the cornea called Descemet's membranes once this break the aqueous will go within the corneal stoma and will accumulate there→with chronicity it will end up with scaring

$Chronic\ inflammatory\ process\ {\rightarrow} chronic\ vascularization {\rightarrow} scaring\ {=}\ Stromal\ opacities$

 Usually the cornea is Avascular tissue so once you have vascularity reaching the cornea you will have leakage of inflammatory mediators→<u>scaring and</u> lipid deposit

Corneal scar

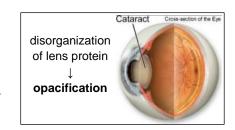

- Penetrating globe injury →underwent primary repair→suturing the wound → ended up by corneal scar
- this patient has trauma penetrating globe injury the scaring isn't the issue here you need to maintain the integrity of globe
 - لأن فيه احتمال لو ماتخيط زين ممكن يفتح وندخل في مشاكل الانفكشن مثل الاندوفثلمايتس اللي ممكن
 تنتهي بفقدان البصر

3.LENS "CATARACT" الماء الأبيض

Pathophysiology:

- At age of 40 or more the lens will loss its elasticity "less accommodation" because of disorganization of lens protein
 →opacification they will start to wear eyeglasses or complaints of loss of near vision
- Why do we have development of cataract, gray hair and wrinkling of skin start at the age of 40? Same embryological origin.

Cause:

- o Age related the most common
- Metabolic DM
- o Traumatic
- o Congenital: Unilateral or bilateral You need to rule out another pediatric syndrome
- Drugs: Steroid(The problem not only develop posterior sub capsule cataract they will develop Glaucoma as well)
- Inflammation Uveitis
- o Ocular: Patient with Retinitis pigmentosa

Clinical Classification:

According to The Maturity							
Immature	Mature	Hyper-Mature					
• you can see the posterior pole "fundus"	 you will never see the posterior pole "fundus" The whole lens is opaque white The anterior chamber is shallow(narrow) →Risk of glaucoma, so do a prophylaxis which is iridotomy. 	 The lens protein starts to leak through the capsule It is advance part of mature cataract causing open angle glaucoma 					
According the Anatomic location *IMPORTANT*							
Nuclear	Sub capsular Posterior Subcapsular Cataract in Cross-Section	Cortical					
Nuclear Cataract in Cross-Section Items cortex cornea lens cataract lens cataract lens capaule	cornea — lens cortex porterior poterior in successor la rest arect lens cupa.ile	Cortical Cataract in Cross-Section Ins cortical cataract lens capsule					
Nuclear Cataract Ins	Posterior Subcapsular Cataract From Technology Justine 16 Gard No. Gar	Cortical Catavact Ins Ins Ins Ins Ins Ins Ins In					
Congenital	Infantile	Pre-senile & Senile					

Clinically:

- o Painless loss of vision gradual onset
- o Visual acuity: worsening of existing myopia, correction of hyperopia
 - → Especially patient with **nuclear sclerosis**, why? Because refractive power of lens will increase, and the image will become more anterior to Retina—worsen of myopia and correction of hyperopia hyperopia and correction of lens will increase, and the image will become more anterior to Retina—worsen of myopia and correction of hyperopia hyperopia length le
- o Loss of contrast sensitivity in low light مايقدرون يفرقون بين درجات اللون الواحد مثلا الأزرق يشوفونه لون واحد مايقدرون يميزون السماوي الكحلي
- o Glare in bright light (scatter of light): Especially in posterior subcapsular cataract. most of the time this is the complain of patient who drive at the night.

Treatment:

Medical Treatment isn't effective! So Simply you have a cataract you need to remove it by extraction

- Congenital: lens aspiration ± IOL (intraocular lens) remove the optical lens→replace it with new one and keep the capsule
- Acquired:
 - ECCE(Extracapsular cataract extraction) + PCIOL(posterior chamber intraocular lens): "very severe cataract"
 - or Phaco (Phacoemulsification) + PCIOL
 Phaco is modified ECCE: small opening and putting a foldable lens.

4.VITREOUS

Causes:

o Vitreous hemorrhages:

→ <u>Causes:</u> trauma, PDR(Proliferative diabetic Retinopathy)DM is the most common cause, uveitis, PR

O Vitreous condensation, opacification:

→ <u>Causes:</u> Chronic inflammation, Other cause is posterior vitreous detachment (PVD),the vitreous is a jelly like transparent structure once it detached from its insertion it will shrink and cause condensation, sometimes it will affect the vision.

o Vitritis:

→ <u>Causes:</u> uveitis (Pic: Vitreous haze because of inflammation)

Treatment:

- o Treat the underlying causes
- o Most of the time you will do vitrectomy= removal of vitreous

الماء الأزرق أو السويرق 5.GLAUCOMA

The significance: video

- o **Second** leading cause of blindness! Early diagnosis is crucial to prevent loss of vision
- o Why it is important? Because it's common, cause irreversible blindness and Silent disease

ليه اسمه الماء الأزرق هل لأن العين زرقاء؟ ممكن لكن هذا فقط اذا كانت من الولادة الأصح بأن المرضى المصابين يرون حلقات زرقاء على الضوء

Signs:

 High IOP + Characteristic optic nerve head changes + visual field loss secondary to nerve fiber layer loss + Gonioscopy: open or closed angle "will be discussed next page"

Symptoms:

- O Initially Asymptomatic.usually pts will come in later stages when they lose their sight or incidentally by follow up. مهم تفهمون ان ارتفاع ضغط العين ممكن يجي بألم شديد جدا بالعين وحواليها ومعه صداع وممكن يجي بدون أعراض وللان محد يعرف السبب بس لو فيه ألم بالعكس جدا مهم لي كطبيب بيكون منذر لي عشان انتبه وحواليها ومعه صداع وممكن يجي بدون أعراض وللان محد يعرف السبب بس لو فيه ألم بالعكس جدا مهم لي كطبيب بيكون منذر لي عشان انتبه وحواليها ومعه صداع وممكن يجي بدون أعراض وللان محد يعرف السبب بس لو فيه ألم بالعكس جدا مهم لي كطبيب بيكون منذر لي عشان انتبه على مابحسون يشيء أبدا
- Usually detected on routine examination
- Glaucoma starts with peripheral (navigational) vision involvement. No central vision problem that why Most of the patient comes late!

NORMAL VISION

EARLY GLAUCOMA

ADVANCED GLAUCOMA

Risk factors:

Age, Family history, IOP, Medication "Steroids", DM / HTN and Myopia
 IOP is the single factor to be controlled. Normal is 10-21mmHg

Aqueous humerus: video

Active secretion:

- 1- Na/K ATPase.
- 2- Cl secretion.
- 3- Carbonic anhydrase.

Passive secretion:

- 1- Ultrafiltration.
- 2- Diffusion

Optic Nerve Head (ONH) complex evaluation:

In clinic do detailed optic nerve exam because you might have:

- glaucomatous optic nerve head damage
- Anomalous disc
- Disc pallor because of CNS or DM

What to evaluate:

- Disc margin and disc diameter
- Cup/disc ratio:
 - How to estimate it? Take the vertical ratio if more than 0.3 we should worry
 - normal value is 0.3, bigger cup=more nerve tissue loss! Cause for large cups: glaucoma
- Neuroretinal rim: area of axon
- o Disc size
- o PPA: peripapillary atrophy
- o NFL defect (nerve fiber layer)
- o Optic disc hemorrhage

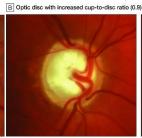

بجيب لكم بالاختبار صورة للجلكوما ركزوا بالفايندينقEmpty central part = cup

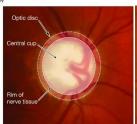

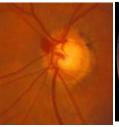

Central cup

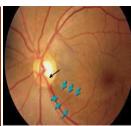

Rim of nerve tissue

Cup/Disc ratio=C/D

Notice: increase cupping, thinning of neuroretinal rim Option

Optic disc hemorrhage

Blue arrows: wedge shape NFL loss

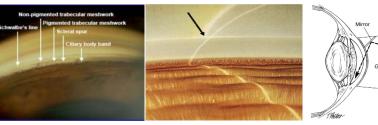

Normal optic disc

Gonioscopy or zeiss gonioscopy lens:

Why we use gonioscopy We need to check the angel between the iris and cornea **to classified Glaucoma** either open angel or closed.

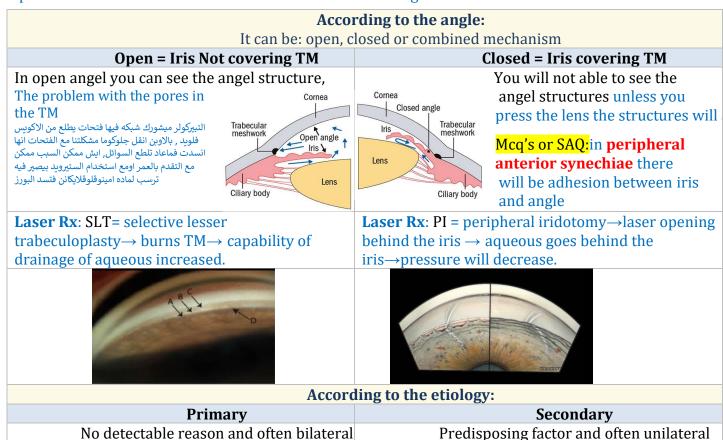

"احفظوها" Norma Angle structures

- o Schwalbe's line (SL)
- o Trabicular meshwork (TM)
 - Non pigmented
 - Pigmented
- o Sclera spur (SS)
- Ciliary body

Classification of glaucoma:

It is important to know the classification because different management

Treatment:

Treatment is aimed at reducing intraocular pressure by 3 modalities available

- 1. Antiglaucoma medications
- 2. Laser treatment: discussed above according to the angle
- 3. If no improvement do surgery, Surgical treatment either:
 - a. incisional: trabeculoplasty, iridotomy, Canaloplasty and Ahmad implant
 - b. Non incisional

6.MACULAR DEGENERATION(MD)

AGE RELATED MACULAR DEGENERATION

Introduction:

- o Impaired central vision, Peripheral vision preserved. Opposite to glaucoma
- o Leading cause of **legal blindness**¹ in developed world.
- o Classical presentation of those patient: Many RTA Or he will till you I cannot park my car

Symptom: احفظوها زين

- o Metamorphopsia: distorted vision الرؤيه مطعوجة كأني أشوف اللي قدامي مكسر
- Micropsia: reduction of size of objects
- Macropsia: enlargement of size of objects
- Scotoma: visual field loss

Etiology:

o **Multifactorial**: age, smoking, vascular disease, UV light, diet, and FHx.

Pathogenesis:

- ول شي نتعرف على ابطال القصة-الطبقات الى بتتأثر Macular involvement:
 - ✓ Outer retinal layer "photoreceptors"
 - ✓ Retinal pigment epithelium (RPE)
 - ✓ Bruch's membrane
 - ✓ Choriocapillaris

1 Drusens

Drusens(yellowish discoloration):lipid products from photoreceptor outer segments, found under retina.

- EXPLANATION: photoreceptors will secret lipids "Drusen" →accumulates under bruch's membrane, once the RPE can't clear them it will accumulate in larger amount
 - \rightarrow irregularity in RPE \rightarrow raising the choroid and the RPE \rightarrow \underline{could} lead to:
 - ✓ separation of photoreceptors→small object "micropsia"
 - ✓ or Accumulations of Photoreceptors→Macropsia
 - With chronicity of disease the photoreceptors will Atrophied→start to loss vision
 - When there is area atrophied, area small objects and area large objects these called Metamorphopsia

2 Neovascularization

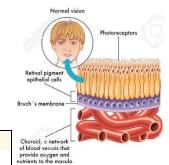

MCQ: With ischemia new vessels from choroid grow into the subretinal space forming subretinal neovascular membrane or preaching the Bruch's membrane

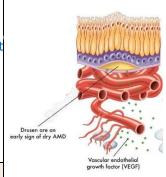

-any new blood vessels in abnormal place are ABNORMAL-

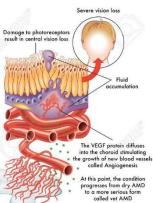

3 Hemorrhage

-the new vessels are very fragile can bleed easily-

- New vessels is bad Either it continues to vitreous causing **vitreous hemorrhages** or it will bleed under the RPE causing sub **RPE hemorrhage**s or it will bleed under the internal limiting membrane and causes **subhyaloid hemorrhage**.
- Hemorrhage into subretinal space or even through the retina into the vitreous (significant loss of vision).

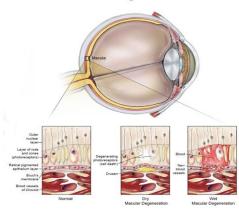

باختصار تجمعت الدهون تحت منعت التغذية و الدم صار فيه اسكيميا جاء الكورويد فزع وسوا اوعية جديدة اللي احنا ما نبغاها لانها بسرعة بتنقطع من اتفه شيء وتدخلنا في مشاكل النزيف بالشبكية وفقدان البصر بالذات لو جاء النزيف في الفيتروس

¹ When we call someone legally blind? If the Central visual acuity of 20/200 or less

Types:

Macular Degeneration

Atrophic = dry	Exudative = wet		
Most benign, often asymptomatic. Gradual over years	Rapidly progressive (weeks)		
Signs:	Signs:		
• Drusen	 Choroidal (subretinal) neovascularization 		
 Geographic atrophy 	 Preretinal hemorrhage 		
 Photoreceptor degeneration 	Elevation of retina		
 scotoma when light adapting 	 Subretinal fibrosis 		
	 Metamorphopsia 		
	 <u>Central</u> scotoma² pic→ 		
Drusen With time will causes RPE atrophy	Preretinal hemorrhage 2 hemorrhages:		
	o grayish: under RPE Bright:above RBE الدكتور يقول لو جتكم بالإختبار الي تحلها صح تستاهل الدكتور يقول لو جتكم بالإختبار الي تحلها صع تستاهل على طول		
Geographic atrophy: Once you lost your	Subretinal fibrosis: The yellowish structures is		
photoreceptors that lead to this Disappearance	fibrosis replaced the photoreceptors کم ان تتخیلو اذا		
	تبدلت الفوتوريسبتور بالفايبروزيز ايش ممكن يصير اكيد بيروح النظر فيها		

What's the difference between dry and wet age-related macular degeneration?

Dry ARMD is when you have drusen and macular RPE atrophy.

Wet ARMD implies choroidal neovascularization that has grown up through Bruch's membrane and bleed into the retina. "Wet" essentially means "bloody" in this instance.

Diagnosis:

Visual acuity	Amsler grid	Ophthalmoscopy	Fluorescein	ICG (Indocyan	OCT(Optical Coher
			angiography	Green)	Tomography)
	If the patient saw wavy lines, then the macula is abnormal			weesals wet AMD with newvessels or ICG to visualize	OCT shows subretinal fibrosis and hemorrhages

² Irreversible visual loss , same as glaucoma but MD less common

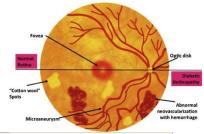

Treatment:

- o If dry:
 - Lifestyle: Stop smoking, reduce UV exposure, Zinc & antioxidants
 - Low-vision aid
 - Monitoring with Amsler chart
- o If advanced, you cannot do anything there is already fibrous tissue:
 - Observation
 - Laser photocoagulation, for neovascular membrane especially for the wet type.
 - Anti VEGF agents. Wet type
 - You don't need to know this: Verteporfin photodynamic therapy (PDT): injection of photosensitizer into systemic circulation followed immediately by laser targeting new vessels in macular area

7.DIABTIC RETINOPATHY *

Pathophysiology:

- Microangiopathy³ which involves precapillary arterioles, capillaries and postcapillary venule. Have 2 mechanisms:
 - 1. Microvascular occlusion
 - 2. Microvascular leakage

1.Microvascular occlusion A. Thick capillary basement membrane. Mean lumen is smaller. Picture show: Abnormal blood vessels like fan new vascularization "NV" B. Capillary endothelial cell damage ⁴⁵ →Retinal ischemia⁶ →AV shunt and NV C. Change in blood cell 2.Microvascular leakage Loss of pericytes between endothelial cells → leakage into retina →exudates and edema Exudate of lipid in Retina Retinal Edema

Risk factor:

Duration, Pregnancy, Nephropathy, Poor metabolic control, Smoking, HTN, Obesity and hyperlipidemia

عشان كذا اغلب مضاعفات السكر تلقونها هنا Microangiopathy= small blood vessels. Most if it presents in Retina, kidney, heart ,and the brain عشان كذا اغلب مضاعفات السكر تلقونها هنا

⁴ Mean lumen narrower and narrower

⁵ increased viscosity of RBC > clot formation > lumen closed > ischemia

⁶ Abnormal new vascularization because of vascular endothelial growth factor from ischemic tissue, this new vessels is fragile and easily bleed and causes fibrosis

Clinical classification: بجيب منها في الاختبار

Non proliferative diabetic retinopathy:

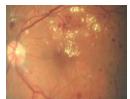

1. Non proliferative DR: mild, moderate and severe.

Pic show macular Edema and the arrow show ischemia

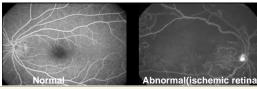

- Asymptomatic
- Decreased visual acuity: Clinical significant macular edema & macular Ischemia

Hemorrhagic spots

florican angiography for a very ischemic Retina "you cannot see the small blood vessels"

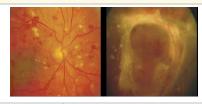

Proliferative diabetic retinopathy:

2. Proliferative DR: early and advance

Treat as soon as possible!

- Symptomatic
- Can causes macular edema and or ischemia

A. Neovascularization

a. NVD: neovascularization of the disc pic above

واضحة جدا تشوفون اوعية كثير متشابكة وتكون حول الديسك

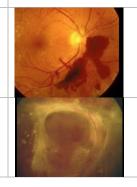

b. NVE: neovascularization elsewhere pic below

تشوفون اوعية كثير متشابكة بعيد عن الديسك

B. Fragile (intra-retinal or vitreous hemorrhage) tractional retinal detachment⁷

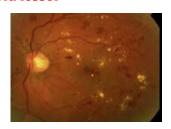

Diabetic Macular Edema:

- Retinal edema threatening or involving the macula
- Evaluate: location of retinal thickening relative to the fovea and the presence and location of exudates
 FOCAL Clinical significant macular edema: ring pattern and leaking in center.
 Treat, focal lesser
 Diffuse hemorrhages and exudate all over no specific pattern
 Treat, Grid lesser

⁷ Recall the types of RD:

[•] Rhegmatogenous RD: you have break ثقب صغير يدخل من خلاله الفلويد ويفصل الرينتا

[•] Tractional RD"in "DR": you have fibrous tissue once its contract it will pulling the Retina

[•] Exudative RD: inflamed choroid layer -> accumulation of fluids under Retina -> detachment

Treatment:

- Laser
- o intravitreal steroid injection
- o intravitreal anti-VEGF injection
- Pars plana vitrectomy

8. RETINITIS PIGMENTOSA(RP) العثى الليلي -

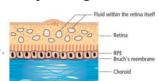

General characteristic:

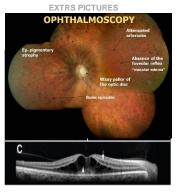

- o Group of genetic disorders affect the retina ability to respond to light پشوف بالنهار افضل
- o **Symptoms** Slow loss of vision:
 - o **Nyctalopia**:loss of night vision.
 - o Tunnel vision8 "loss of peripheral vision"
 - o blindness
- Most are legally blind (Central visual field of less than 20 degrees) by 40s.
- X linked recessive: males: more often and more severe, females: carry the genes and experience vision loss less frequently
- Target photoreceptors and Associated with pigmentary changes in the RPE, which may be primary or secondary to the photoreceptor loss.

Rods important for night vision and cons in day vision but it will affect both of them

Signs:

- Visual acuity varies from :20/20 to no light perception at all.
- +-APD (afferent pupillary defect)
- o **PSCC** (posterior sub capsular cataract)
- RPE hyperpigmentation (bone spicules) alternate with atrophic regions.
- Attenuation of the arterioles "thinning".
- Waxy pallor of the optic nerve head.
- o cystoid macular edema (severe cases of RP) Extra pic→.

RP stages and signs Early stage 2nd stage 3rd stage 4th stage severe faint black spots bone spicules more loss of Severe in periphery photoreceptors loss Increased more and photoreceptor "bone Spicules" More clumping of **Tunnel vision** more **RPE** Start to loss Severe RPE loss and photoreceptors clumping Waxy disc Bone spicules appearance نفس لون الشمع حق Waxy pallor

⁸ Glaucoma have high IOP but in RP not

Investigation:

- VF test tunnel
- Color testing (mild blue-yellow axis color defects)
- o Dark adaptation study (reduced contrast sensitivity relative to VA)
- o Genetic subtyping
- o OCT (CME) Very important to check for cystoid macular edema
- o FFA florican angiography
- o ERG Electroretinography is an eye test that detects function of the retina including photoreceptors
- o EOG Electrooculography to record eye movement

مهمه للي بيتخصص منكم بيديا او نيورو او حتى ميدسن *ارجعولها*:Systemic Associated

- Hearing loss and RP:
 - o **Usher syndrome (MOST IMP THING FOR US)** Usher syndrome is a condition characterized by partial or total hearing loss and RP.
 - Alport syndrome is a genetic condition characterized by RP, kidney disease, and hearing loss.
 - o Refsum disease is an autosomal recessive neurological disease that results in the overaccumulation of phytanic acid in cells and tissues.
- Kearns-Sayre syndrome:
 - o External ophthalmoplegia مايقدر يحرك عينه
 - o Lid ptosis
 - Heart block
 - o Pigmentary retinopathy
- **Abetalipoproteinemia** is a disorder that interferes with the normal absorption of fat and fatsoluble vitamins (\downarrow vitamin A \rightarrow RP)
- Mucopolysaccharidoses
- Bardet-Biedl syndrome genetic disorder characterized principally by obesity, RP, pigmentosa, hypogonadism, and kidney failure in some cases
- Neuronal ceroid lipofuscinosis lysosomal storage disorders characterized by dementia, RP, and epilepsy.

Treatment:

Unfortunately, nothing can be done to prevent the progression of the disease, associated ocular problems can be treated:

- o CAI: CME "Carbonic anhydrase inhibitor work will in patient with RP and CME"
- Vitamins
- Cataract: surgery
- Low vision aids
- o Gene therapy!! خزعبلات

Extra

What's the difference between a PCO and a PSC cataract?

- PCO: posterior capsular opacification. This is an "after cataract" that forms on the back surface of the posterior capsule after successful cataract surgery. This opacity can be cleared with a YAG laser.
- PSC: posterior subcapsular cataract. This is a cataract that forms on the back portion of the lens. These tend to occur more often in diabetics and those on steroids, and tend to be visually significant because of their posterior position.

What drops are given after a cataract surgery? Usually an antibiotic, such as ciprofloxacin or vigamox. Also, a steroid is given to decrease inflammation.

What retinal findings do you see with glaucoma? You see increased cupping of the optic disk, usually in a vertical pattern that goes against the ISNT rule. You can sometimes see hemorrhages at the disk and "undermining" of the blood vessels as they exit the disk.

What's the difference between open-angle and closed-angle glaucoma? How about chronic versus acute glaucoma?

- Open angle is a common, chronic condition where aqueous drainage is impaired.
- Closed-angle glaucoma is caused by acute closure of the iridocorneal angle leading to blockage of ALL aqueous drainage an ophthalmologic emergency that can quickly lead to blindness.

What are the retinal signs of diabetic retinopathy. How do they compare to, say, hypertensive retinopath?. With diabetic retinopathy you typically see a lot of dot-blot hemorrhages, cotton-wool spots, and hard exudates. Hypertension usually has more flame hemorrhages and vascular changes such as arterial-venous nicking and copper/silver wiring.

How do we categorize diabetic retinopathy? As either NPDR (nonproliferative diabetic retinopathy) or PDR (proliferative diabetic retinopathy) depending upon the presence of neovascularization.
