

Common Thyroid & calcium Disorders in Children

Dr.Reem Al Khalifah

Consultant

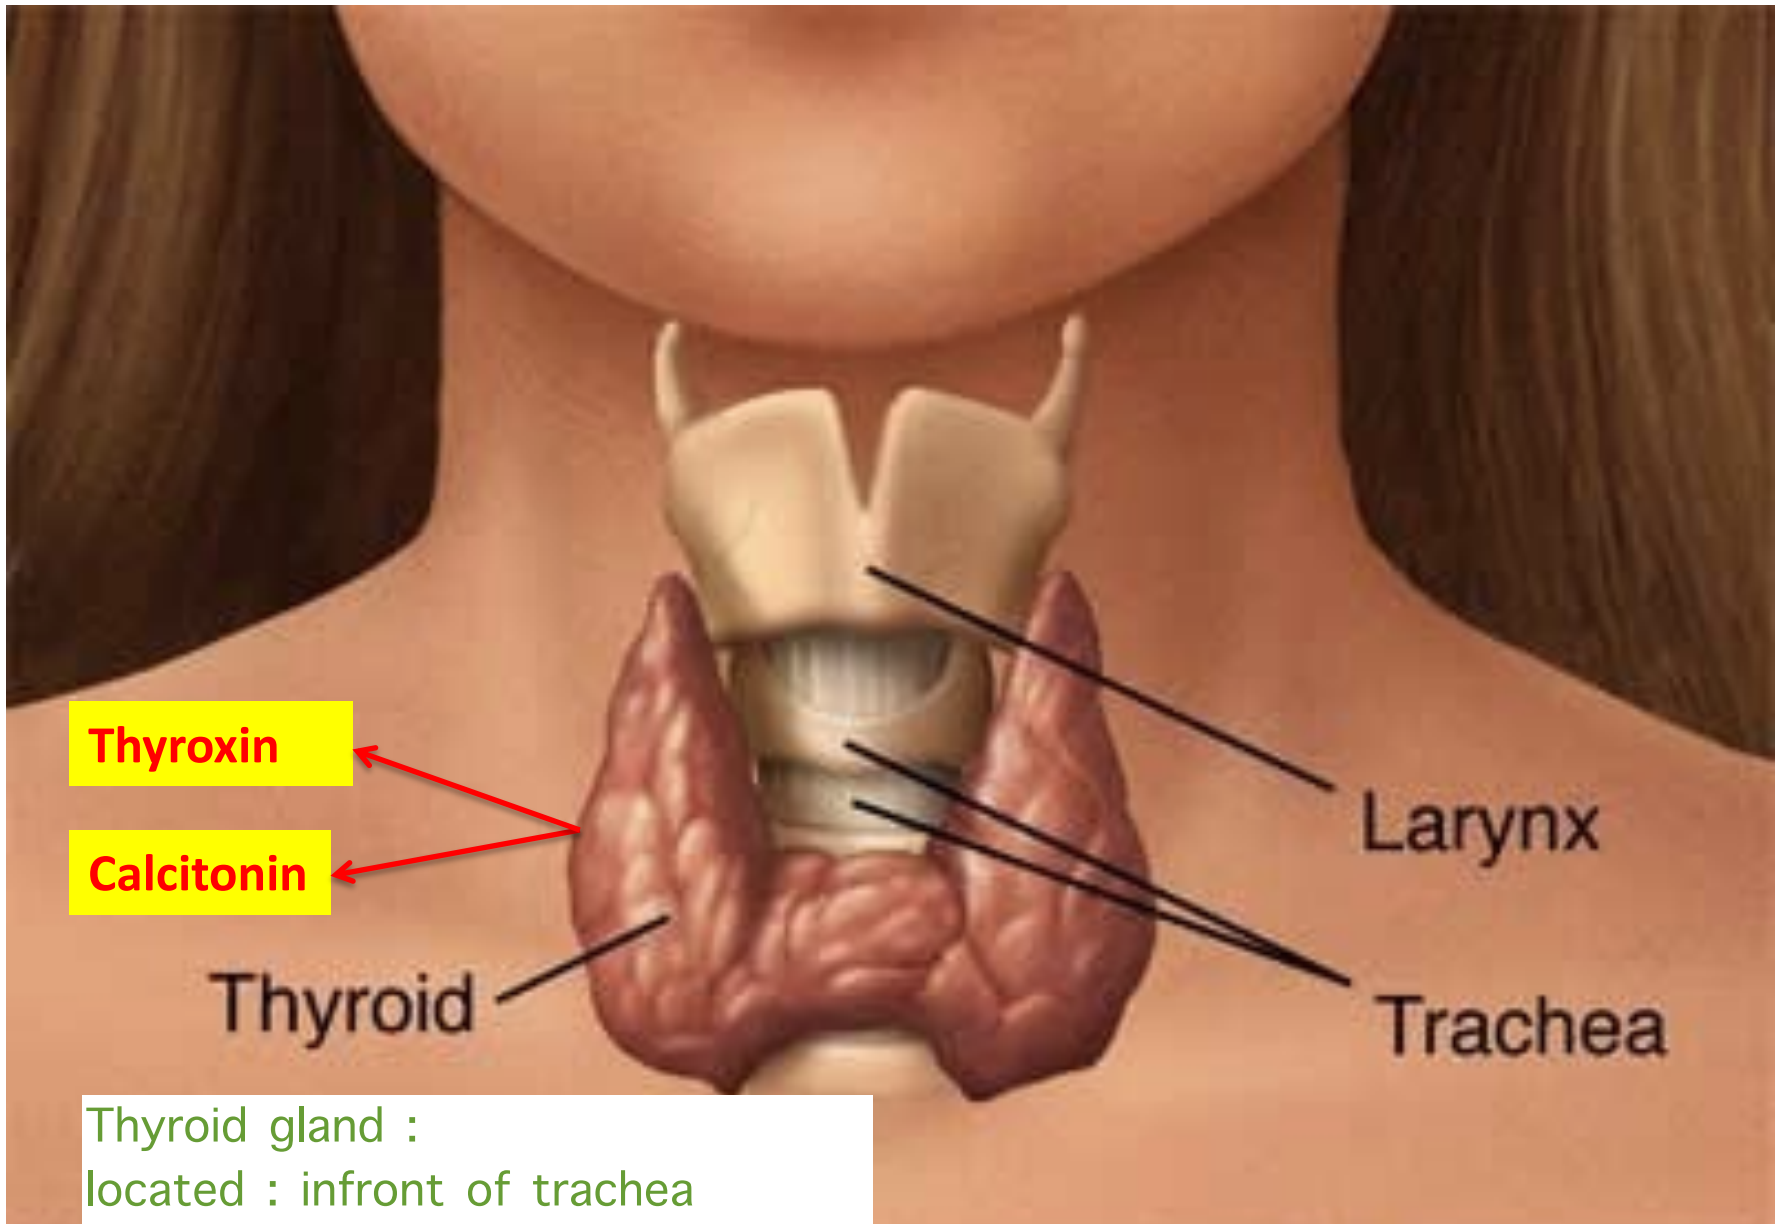

Assistant professor

Pediatric Endocrinology

King Saud University

Objectives

- Thyroid Anatomy and physiology
- Hypothyroidism
- Hyperthyroidism
- Rickets

Thyroxin

Calcitonin

Thyroid

Larynx

Trachea

Thyroid gland :
located : in front of trachea
Secrete : thyroxin, calcitonin

this secretion is regulated through secretion of hypothalamus (TRH)^{oid}
 —> pituitary (TSH) —> thyroids (T₄/3)—> -ve feedback on TRH
 Also TRH is inhibited by : Dopamine, Somatostatin, glucocorticoids

Thyroid follicles

Colloid

Section of thyroids gland :
Follicle and each follicle contain colloids inside it

Note next slide

you don't have to memorize this pathway but doctor said understanding it will help you when something get wrong to know the abnormality that cause it

1- dietary iodide in blood vessels until it reach thyroid then it get transported through iodide transporter to

2- thyroid cells —>

- lumen : where oxidation to iodine and coupling happen then get endocytosis back to

- cells : where proteolysis happen to get excreted as T3/4 into the blood

QUESTION:

if you have problem at the level of transporter —> no iodine is going inside —> no T3/4 —> hypothyroidism

what is the aetiology of this hypothyroidism is it autoimmune or other process ?

Ans: usually this is congenital hypothyroidism due to Dyshormonogenesis (due to problem in the cycles)

Thyroid Function: blood tests

| | |
|----------------------------|-------------------|
| TSH | 0.4 – 5.0 mU/L |
| Free T4 (thyroxine) | 9.1 – 23.8 pmol/l |
| Free T3 (triiodothyronine) | 2.23-5.3 pmol/l |

these are KKH normal data which differs from other labs

Most of our production is T4 but it get converted to T3 in periphral circulation

Remember that : we check the T4 level after 6-8w from initiating the treatment (explanation down)

| | <u>T4</u> | <u>T3</u> |
|----------------------------|------------------|------------------|
| Potency | 1 | 10 |
| Protein Bound | 10-20 | 1 |
| Half-Life | 5-7d | < 24h |
| Secreted by thyroid | 100 ug/d | 6 ug/d |

Why we need to know the potency - half life ?

To know how to monitor the treatment affect ; T4 half life is 5-7D while T3 is <24h so the appropriate time to check thyroid hormone levels after starting the treatment (study state level) is after 5-7 half-lives which means **6-8w for T4** and after 1w for T3 this also include when we stop the meds we should wait 6-8w

Effects of thyroid hormones

- Linear growth & pubertal development
- Normal brain development & function
- Calcium mobilization from bone
- Increase in basal metabolic rate
- Inotropic & chronotropic effects on heart
- Stimulates gut motility
- Increase in serum glucose, decrease in serum cholesterol
- Play role in thermal regulation

In
pediatrics

less than 3y

The part of the brain affected by thyroid hormone is myelination of the axons which are completed by 3y so hormone agenesis → it will impact the IQ level

HYPOTHYROIDISM

Causes of hypothyroidism

Primary

- Congenital
- Autoimmune (Hashimoto)
- Iodine deficiency
- Subacute thyroiditis
- Drugs (amiodarone)
- Irradiation
- Thyroid surgery

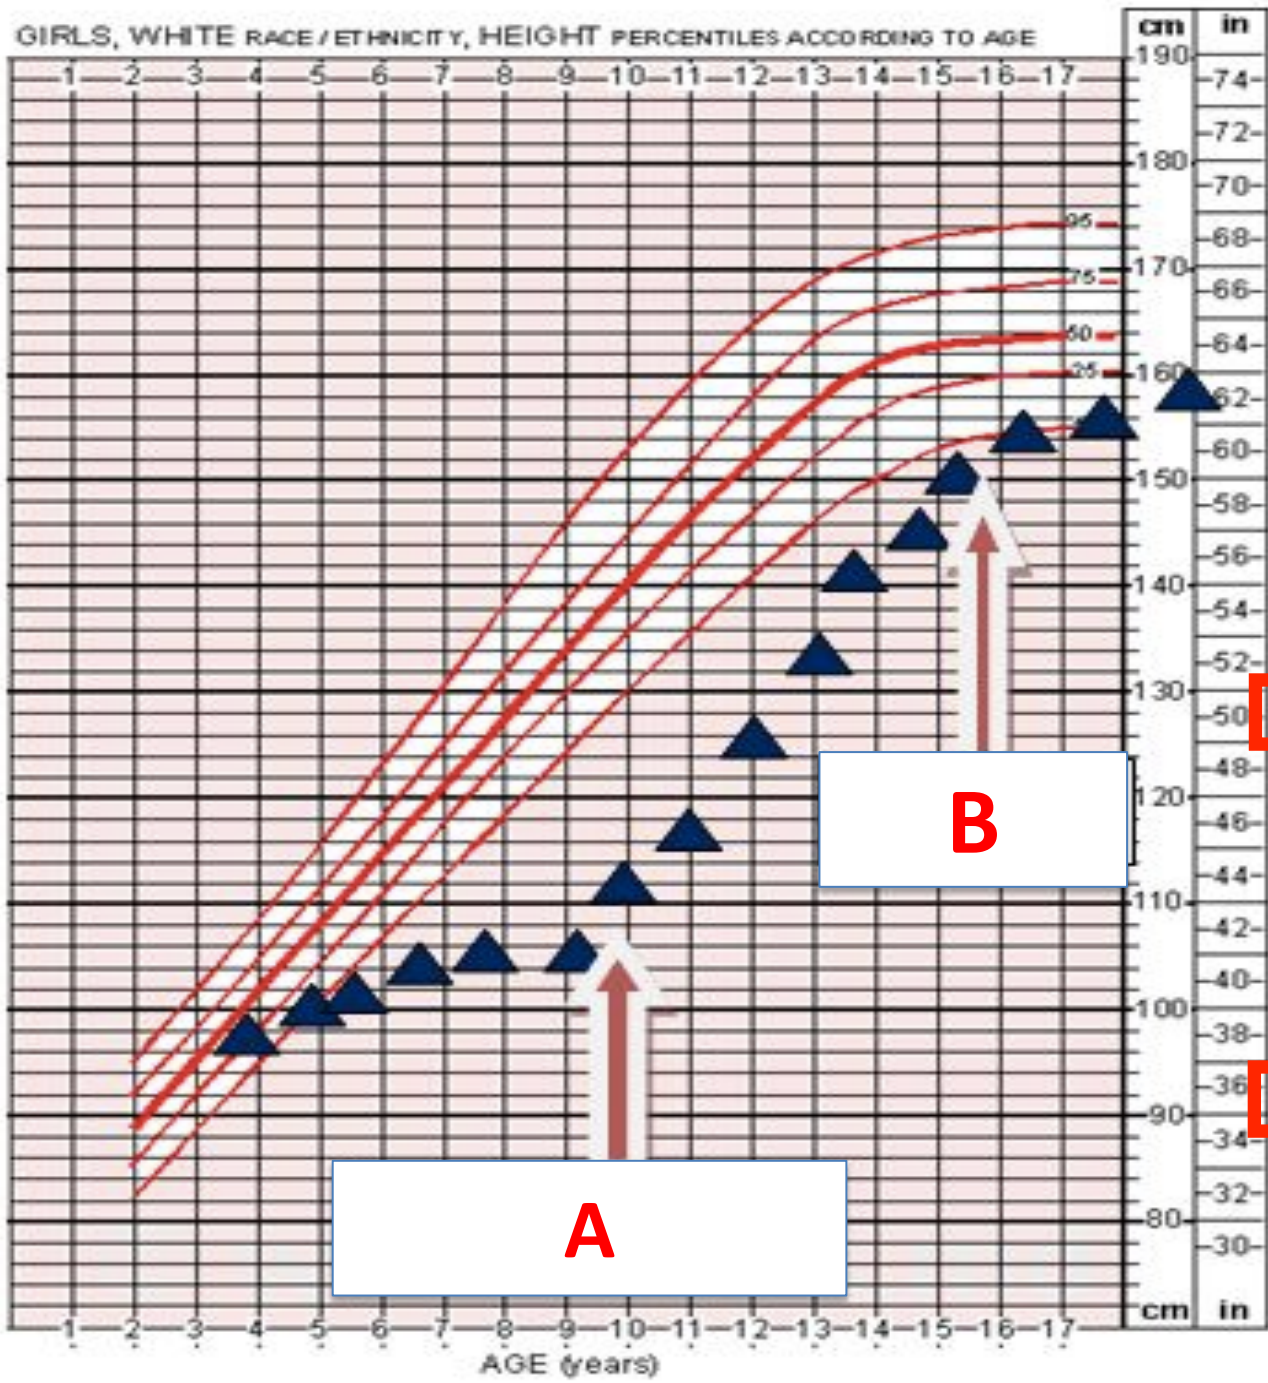

Secondary

- TSH deficiency
- TRH deficiency

Secondary caused by : in (I) :
ischemia
iatrogenic (surgery)
idiopathic
infiltration (tumor)
infection

Clinical features

- Poor growth **Stop growing** (Short stature)
- Delayed bone age
- Poor school performance Low IQ in less than 3y + thinking will be slow
- Delayed puberty
- Weight gain
- Fatigue
- Constipation
- Goiter
- Dry skin
- Cold Intolerance
- Sinus Bradycardia
- Delayed reflexes

Highlight :

pediatric
not
replacing
thyroxine
they wont
grow.

if u
replace
they will
grow

Girls growth chart
Height :
plateau until point
A then start
increase until B

A: Thyroxine

pt was
hypothyroidism
until point A
where we give her
thyroxine

B: Menarche

pt stop growing
due to menarche
(final adult height)

Primary Hypothyroidism

Way to diagnose it :

- Decreased thyroid hormone levels
 - ↓↓T4
 - Possibly ↓ T3
 - ↑TSH

Issue in thyroids

Secondary Hypothyroidism

- Decreased thyroid hormone levels
 - ↓↓ T4
 - ↓ T3
 - ↓ TSH

Issue in Hypothalamus or pituitary
TSH is the difference

Hashimoto's thyroiditis

- Most common cause of hypothyroidism
- Autoimmune lymphocytic thyroiditis
- Antithyroid antibodies:
 - Thyroglobulin Ab
 - Microsomal Ab
 - TSH-R Ab (block)
- Females > Males
- Runs in Families!

Congenital Hypothyroidism

- 1 in 3000-4000 neonate
- The most common cause of treatable and preventable mental retardation..... The earlier dx the better IQ by replacing the thyroxin early
- Congenital Anomalies increased by 10%(cardiac)
- In more than 90% of the cases it is permanent we will continue the thyroxin for life even if menarche start and growing was stopped

Impact on IQ when diagnosis is delayed

| Age of Diagnosis | % with IQ > 85 |
|-------------------------|--------------------------|
| 3 months | 78% |
| 6 months | 19% |
| > 7 months | 0% |

for exp : if u dx after 7m almost all baby will have IQ less than 85% which is equivalent to = mental retardation

Congenital Hypothyroidism: Causes

- **Aggenesis** Glands are not formed
- **Dysgenesis** Glands are formed abnormally
- **Dyshormonogenesis** Thyroids is formed normally but there is problem in the cycle
- **Ectopic gland**
- **Iodine deficiency**
- **Maternal anti-thyroid medication**

Clinical Features of Congenital Hypothyroidism in babies

| Finding | % |
|-------------------------|------------|
| Lethargy | 96% |
| Constipation | 92% |
| Feeding problems | 83% |
| Respiratory problems | 76% |
| Dry skin | 76% |
| Thick tongue | 67% |
| Hoarse cry | 67% |
| Umbilical hernia | 67% |
| Prolonged jaundice | 12% |
| Goiter | 8% |

Lingual thyroid = ectopic gland = not working

- large protruding tongue

- baby looks lethargic

- Baby face look older

B

lethargic baby
protruding tongue
Umbilical hernia
(*)Folds → issues
in wight gain
elderly look (called :
wizened look)

C

A

Congenital Hypothyroidism

suspect

~~Clinical~~ it going to be too late

Biochemical (screening)

Newborn :at first day of life

Confirm

Lab (TSH & FT4)

Optional

to understand the cause

✓ T scan

✓ Bone age

✓ US thyroid

Rx

Thyroxine

Follow up

Growth

TSH & FT4

Newborn Screening

Management

High TSH & Low T4

Levothyroxine (T4)

we said Normal T4 needs 6-8 w but we start observe the rising from the 2nd w to reach the normalization on 6-8w

Dose

10 -15 ug/kg/day
12 -17 ug/kg/day
37.5 – 50 ug/day

**Higher dose in
Severe cases**
T4 < 5ug/dl

Form

Tablets
25-50-75 ug
Crush it, add to
5-10 cc water
Or milk

Goals

Normal T4
In 2 wks
(upper 1/2 of N)

Normal TSH
In one month
(lower 1/2 of N)

- Never give syrup
- give it on empty stomach and wait 30m to feed
- give it at the same time every day

Newborn Screening Criteria

test done on the 1st to 3d of baby life

- Aim is to identify affected infants before development of clinical signs
- High incidence 1/3,000 to 1/4,000
- Mental retardation if not treated
- Levothyroxine \$3.00 cost → cheap

Other screening test :

- Metabolism error : galactosemia , phenylketonuria
- Endocrine : congenital adrenal hyperplasia, congenital hypothyroidism

Screening Technique

- Specimen is a blood spot on a filter paper
 - Obtained by heel prick
- Or
 - cord blood
- **TSH** or **TSH+FT4** or **FT4** depend on the hospital
KKUH → we do TSH

What are the cases that you will not diagnose with screening that depend on TSH only ? Secondary hypothyroidism

cuz in our hospital test the cut-off point for TSH is 30 if the TSH was
>30 → congenital hypothyroidism
<30 → it could normal or 2ndary or even tertiary hypothyroidism

Neonatal Screening

Blood Specimen Collection and Handling Procedure

how we draw blood :
we prick the lower outer part (the shed part) after wiping with alcohol

1 Equipment: sterile lancet with tip approximately 2.0 mm, sterile alcohol prep, sterile gauze pads, soft cloth, blood collection form, gloves.

2 Complete ALL information. Do not contaminate filter paper circles by allowing the circles to come in contact with spillage or by touching before or after blood collection. Keep "SUBMITTER COPY" if applicable.

3 Hatched area () indicates safe areas for puncture site.

4 Warm site with soft cloth, moistened with warm water up to 41°C, for three to five minutes.

5 Cleanse site with alcohol prep. Wipe DRY with sterile gauze pad.

2-1448 (10/01)

FORM NO. 10/01

then we fill these circles with blood

6 Puncture heel. Wipe away first blood drop with sterile gauze pad. Allow another **LARGE** blood drop to form.

7 Lightly touch filter paper to **LARGE** blood drop. Allow blood to soak through and completely fill circle with **SINGLE** application to **LARGE** blood drop. (To enhance blood flow, **VERY GENTLE** intermittent pressure may be applied to area surrounding puncture site). Apply blood to one side of filter paper only.

8 Fill remaining circles in the same manner as step 7, with successive blood drops. If blood flow is diminished, repeat steps 5 through 7. Care of skin puncture site should be consistent with your institution's procedures.

9 Dry blood spots on a dry, clean, flat non-absorbent surface for a minimum of four hours.

10 Mail completed form to testing laboratory within 24 hours of collection.

Good Specimen

FILL FIVE CIRCLES WITH BLOOD

BE SURE IT SOAKS THROUGH

IQ Outcome

for hypothyroidism baby

Pre-screening

average IQ in pre-screening era

- **76**

Post-screening

- **104** which is normal

clinical features of hypothyroidism

post screening era

> screening

prescreening era

< screening

wheel chair pt with with low IQ
face look abnormal

A man and 3 females (age range, 17-20 y) with myxedematous cretinism from the Republic of the Congo in Africa, a region with severe iodine deficiency.

Treatment of Hypothyroidism

- Replacement thyroid hormone medication:
Thyroxine

Your turn

- 2 days old baby has a TSH= 150, FT4= 5 on newborn screening. what is your next best step:
 - A. Repeat TSH, FT4, follow up in 1 week
 - B. Do US thyroid after 1 week
 - C. Start levothyroxin 50mcg
 - D. repeat TSH, FT4 and start treatment

Ans : D

if I can't do test then I will start treatment (due to age) never delay

HYPERTHYROIDISM

Causes of hyperthyroidism

- Graves Disease
- Overtreatment with thyroxine
- Thyroid adenoma (rare)
- Transient neonatal thyrotoxicosis

Hyperthyroidism

- Increased thyroid hormone levels
 - ↑ T4 +/- High T3
 - ↓ TSH (suppressed) due to -ve feedback

Graves' Disease

- Most common cause of hyperthyroidism
- Autoimmune process
- TSH-R stimulating antibody
- 40-70% relapse after 2 years of treatment

Clinical manifestations

- Heat intolerance
- Hyperactivity, irritability
- Weight loss
- normal to increased appetite
- diarrhea
- Tremor, Palpitations
- sweating
- Lid retraction & Lid Lag (thyroid stare)
- Proptosis
- menstrual irregularity
- Goitre

staring look : lid retraction = upper part of the iris is not covered with lid

"Exophthalmos"

Grave's
ophthalmopathy

Hyperthyroid Eye Disease

lid lag sign

Investigations

- TSH, free T3&T4
- Thyroid antibodies (TSH receptors antibodies)
- Radionucleotide thyroid scan (increase uptake)

Thyroid Scan in Thyrotoxicosis

Graves' Disease

increase uptake bilateral homogenous

single nodule uptake

Follicular Adenoma

Multinodular Goiter

increase uptake irregularly

Subacute Thyroiditis

No uptake

Treatment

- *Beta*-blockers stop the affect of hormone on heart
- Carbimazole
- PTU (propylthiouracil)
- Radioactive iodine (in adults) to destroy most of the gland
—> decrease hormones
- surgery

RICKETS

Calcium in Blood

Parathyroid Glands

function : Increase Ca in the blood

PTH

Bone Releases Calcium

Kidney
1. Returns Calcium

2. Makes Vit D3
the active form

Intestines Absorb More Calcium

Ca^{2+}

Ca^{2+}

Ca^{2+}

Major Vit D come from the sun through our skin OR minor from intestine (diet) → to the liver get hydroxylation to 25(OH) → Go to kidney get hydroxylation to 1-a25(OH) → go to :

- Intestine → increase absorption of Ca
- Bone → mineralization

Calcitonin

- It is a calcium lowering hormone
- Secreted by Thyroid C cells

Anti - PTH

Rickets

- Reduced **mineralization** of bone matrix due to calcium deficiency.

Rickets

Causes :

Vitamin D Deficiency

Nutritional

Intestinal malabsorption

anticonvulsants

Rickets of prematurity

Hepatobiliary

exp: Celiac

Renal

Renal osteodystrophy:CRF

Familial hypophosphataemic rickets

Renal tubular acidosis

Fanconi syndrome

Vitamin D dependent type 1 rickets

Vitamin D dependent type 2 rickets

Risk factor for Rickets caused by nutrition

Inadequate sun exposure

- Indoor environment
- Extensive cloth cover
- Sunscreen, exposure through glass
- High altitude

low intake

- winter
- Lactose intolerance
- No vitamin D supplementation
- Low intake of diet rich in vitamin D

Physiologic

- Low socioeconomic status
- Dark skin
- Obesity
- Pregnancy

Pathological

- Aging
- Malabsorptive syndromes
- Hepatic/ renal disease
- Medications: AED, steroids, rifampin, antiviral tx

Who to screen ?

pt with sign of :

- Rickets
- Osteomalacia
- Osteoporosis
- Dark skin
- living in areas with reduced sun exposure
- institutionalized children
- Obesity
- long-term parenteral nutrition
- Chronic kidney disease
- Hepatic failure
- Malabsorption syndromes
- Bariatric surgery
- Radiation enteritis
- Hyperparathyroidism
- Medications: Antiseizure medications, Glucocorticoids, AIDS medications, Antifungals, Cholestyramine
- Pregnant and lactating women
- Older adults with history of falls, or nontraumatic fractures
- Granuloma-forming disorders

Rickets Effect at growth end plate

Inadequate growth plate mineralization.

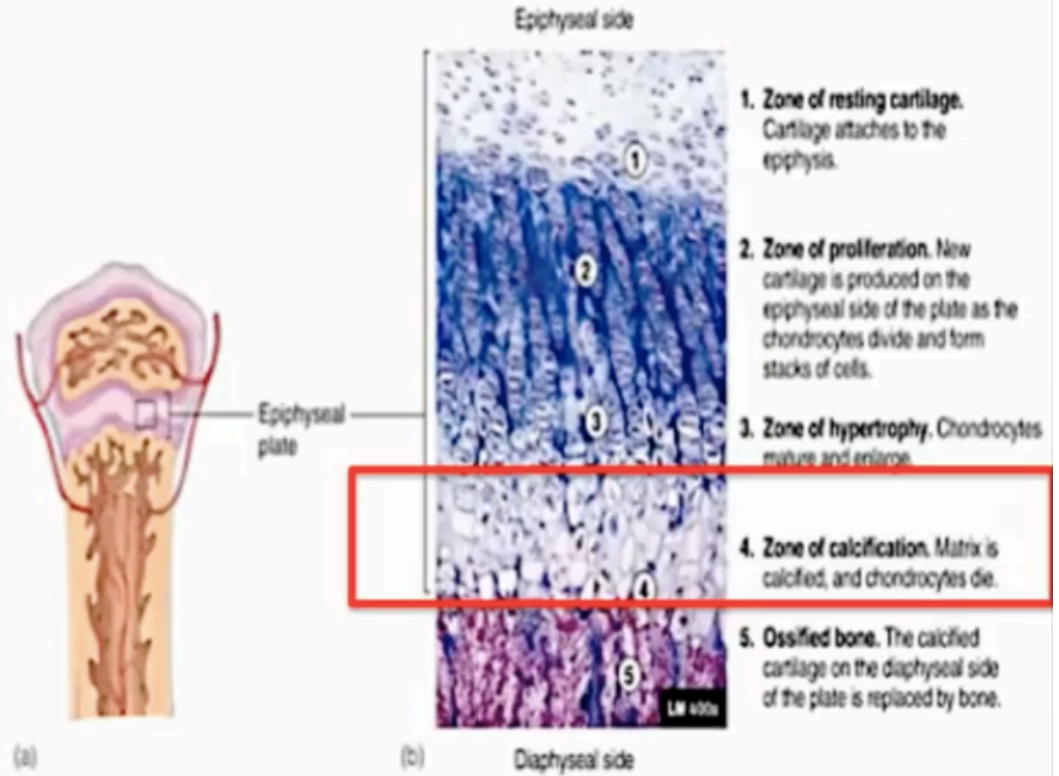

The growth plate increases in thickness.

The columns of cartilage cells are disorganized.

Zones of the Epiphyseal Plate

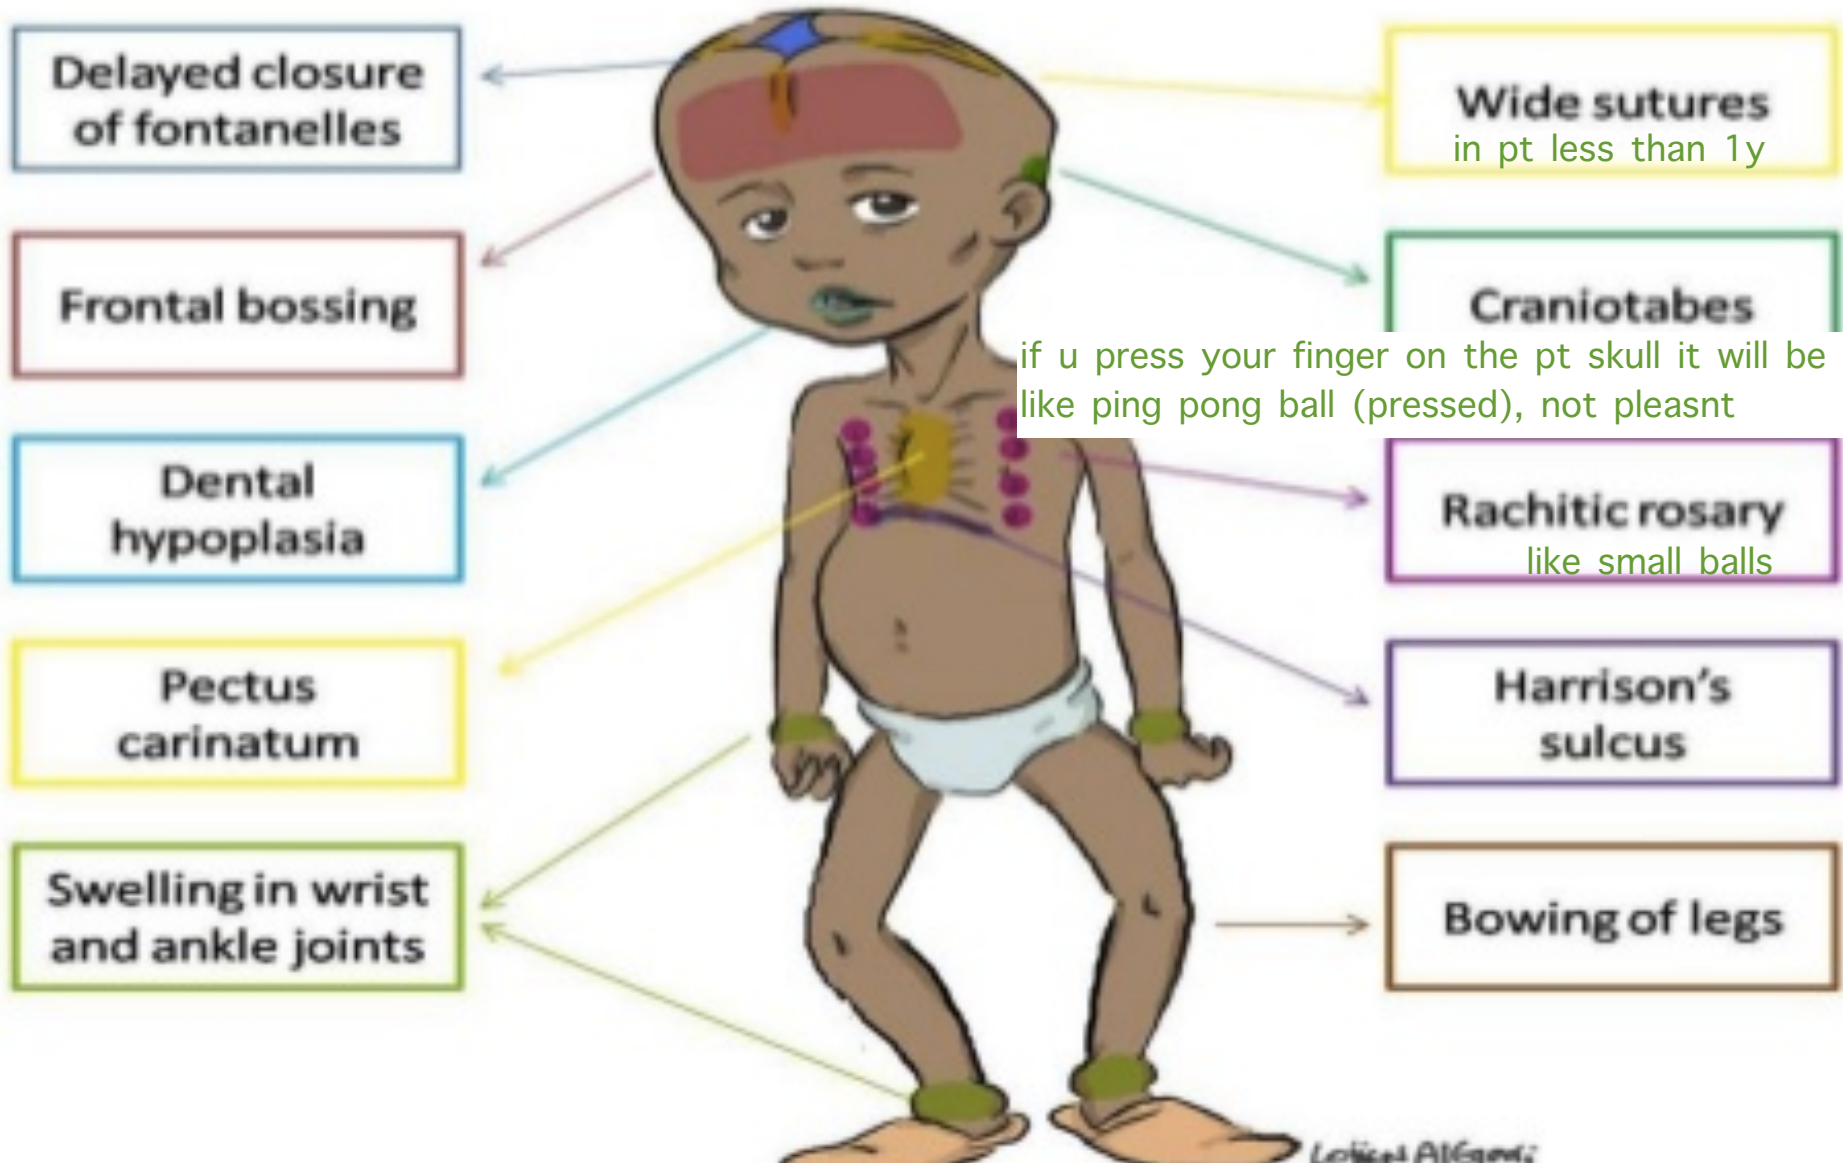

thick growth plate

main part that is affected :
 Zone of calcification —> end up with large hypertrophied cartilages that are not ossified

10 important clinical features in Rickets

Rachitic rosary :
كأنها خرزات

because of
hypertrophied
cartilage in
every
costochondral
cartilage

wide wrist joint

Bowing of the leg

various degree of bowing

Extra – skeletal manifestations

Vitamin D Status nmol/l

| | |
|---------------|---------|
| Deficiency | 50 |
| Insufficiency | 51-72.5 |
| Sufficiency | 75- 250 |
| Excess | - |

TABLE 1 Biochemical Manifestations of Different Stages of Vitamin D Deficiency

| | Plasma Ca ⁺⁺ | Plasma PO ₄ | ALP | PTH | 25(OH)-D | Radiograph Changes |
|----------|-------------------------|------------------------|-----|-----|----------|---------------------|
| Early | N↓ | N↓ | ↑ | ↑ | ↓ | Osteopenia |
| Moderate | N↓ | ↓ | ↑↑ | ↑↑ | ↓↓ | Rachitic changes + |
| Severe | ↓↓ | ↓↓ | ↑↑↑ | ↑↑↑ | ↓↓↓ | Rachitic changes ++ |

we observe early : minor low Vit D - Ca - PO4 level
as the vit D get lower the severe disease will be and severe changes will happen

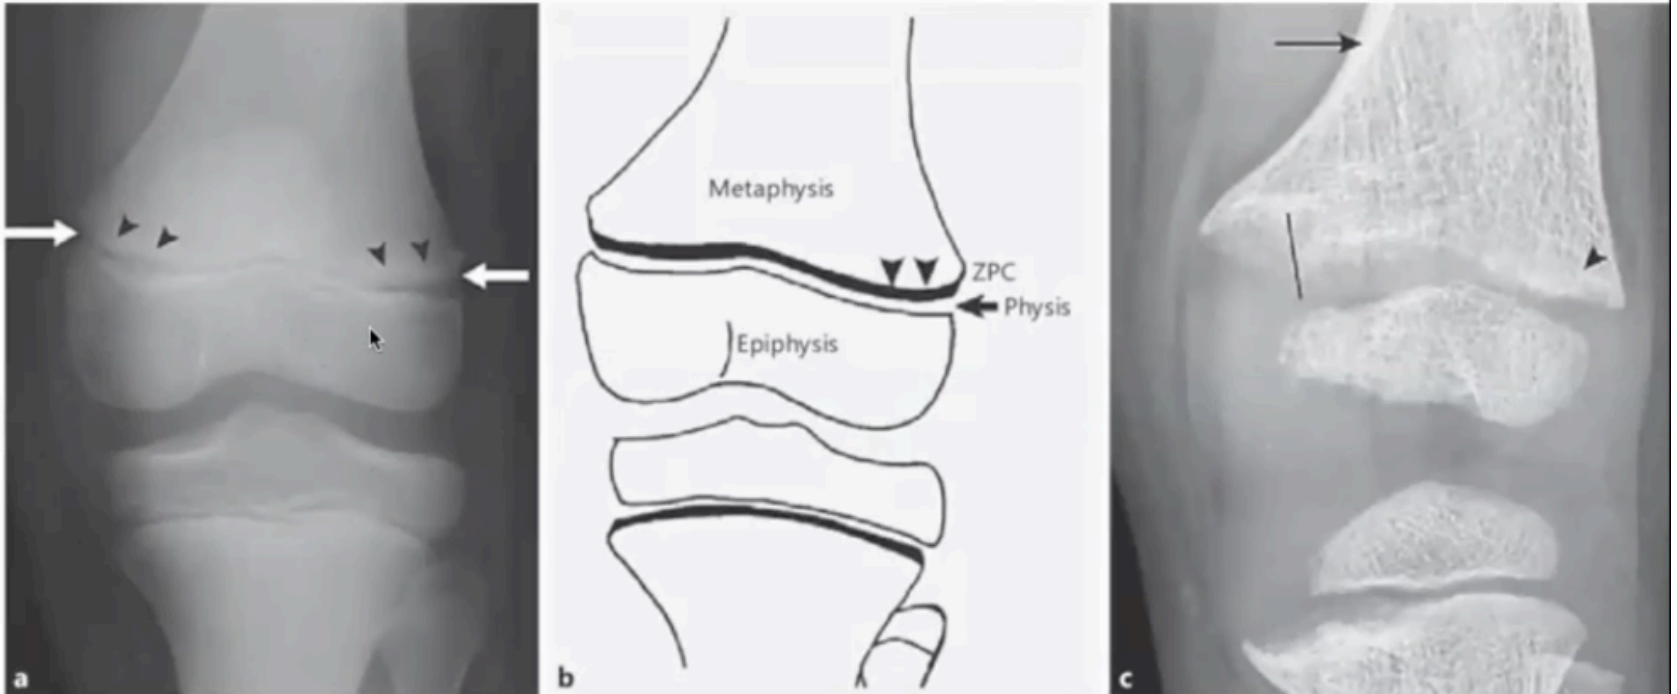

**HOW CAN YOU DIFFERENTIATE
BETWEEN LOW PTH VS. LOW VITAMIN
D ?**

Investigations

| | Vitamin D def | Low PTH |
|-------------|---------------|---------|
| Calcium | ↓ | ↓ |
| Phosphorus | ↓ | ↑ |
| Vit D level | ↓ | N |
| PTH | ↑ | ↓ |

Vit D and PTH take long time in the labs so
How can I know if there is deficiency without knowing Vit D and PTH results?
from the Phosphorus

joints affected by rickets

wide space between Meta and EPiphysis

Cupping and osteopenia

Cupping and osteopenia

Cupping and osteopenia

Vitamin D Resistant Rickets

Type 1

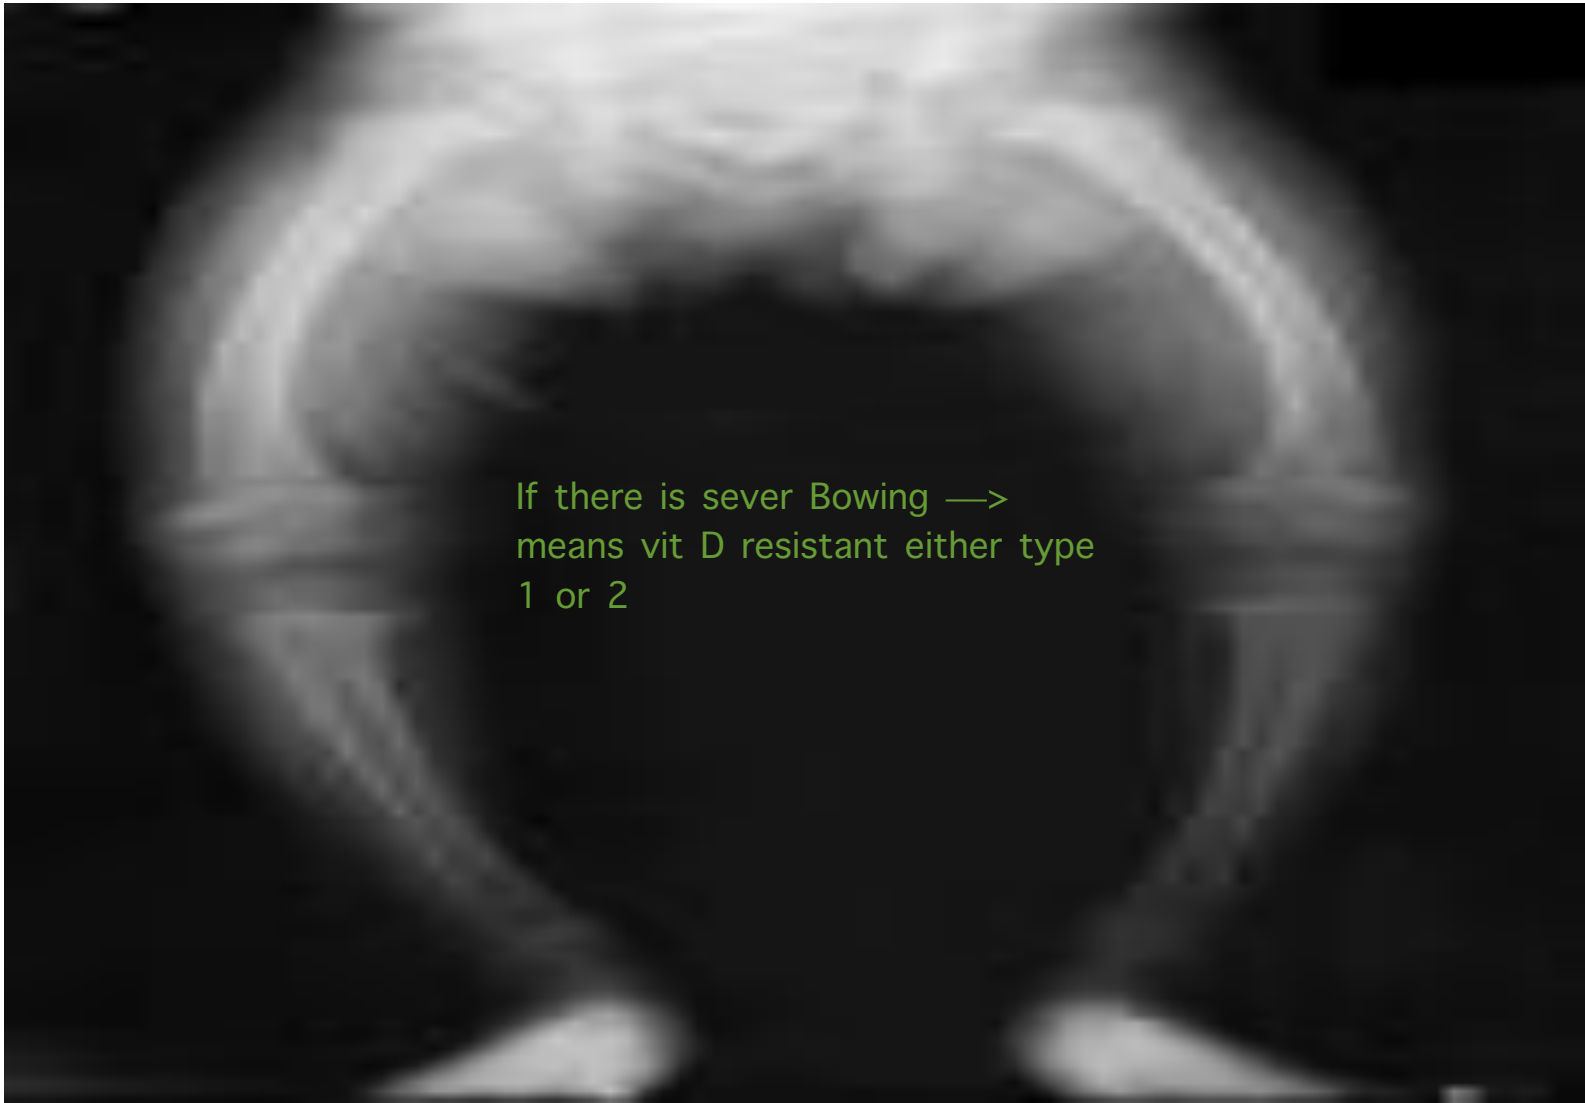

Defective final conversion of Vit. D in to active form

Enzyme deficiency

Type 2

End organ insensitivity

Receptor defect either kidney or intestine

If there is sever Bowing —>
means vit D resistant either type
1 or 2

Vitamin D Resistant Rickets

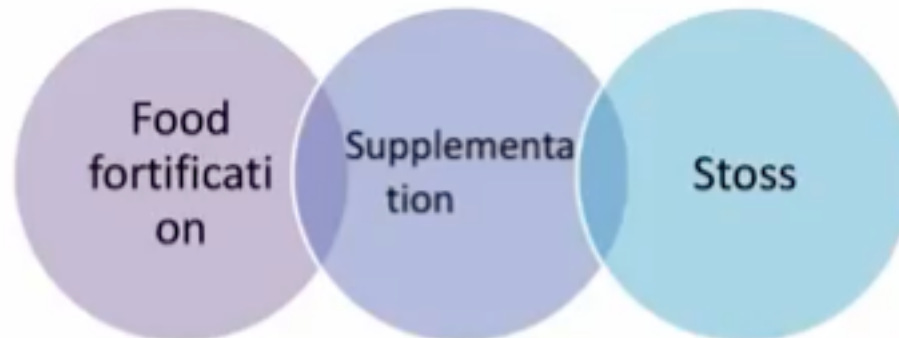

Treatment of nutritional vitamin D deficiency rickets

- Vitamin D supplement:
- 2000-5000 IU daily or 50,000IU weekly for 8 weeks *as adult*
- And calcium supplementation 50-70mg/kg/day *to avoid hungry bone syndrome*

huge dose of Vit D → mineralization of the bone → deposit alot of Ca in the bone → hypocalcemia = Hungry bone syndrome

How to take vitamin D?

- Empty stomach or with a meal
- given three times a year, once a week, or once a day

Source of Vit D

- Full-body exposure for **10 -15** min in an adult with lighter pigmentation = 10,000 - 20,000 IU
- Fortified food
only seafood and egg

Full term 1 year old girl who presented with afebrile tonic clonic convulsions. she has no chronic illnesses or medication. On examination he has no apparent dysmorphic features and his vital signs were normal.

Labs are most likely to show:

- A ↓ Ca, ↓ Phosphorus, ↑ ALP
- B ↓ Parathyroid hormone
- C ↓ Ca, ↑ Phosphorus, ↑ ALP
- d ↓ Ca, ↑ Phosphorus, ↓ ALP

Ans : A

Rickets with hypocalcemic seizures
